A close-up photograph of a white boat's hull and anchor chain against a dark blue sea. The boat's white paint is weathered, and the anchor chain is rusty. A white mooring buoy is attached to the chain. The water is dark and reflects the sky.

**Blockchain  
Scaling**

## Existing cryptocurrencies do not scale (in terms of TPS)

~ 10 tps

Size of transaction in KB

Complexity of transaction in “Gas”

# Why doesn't it scale?

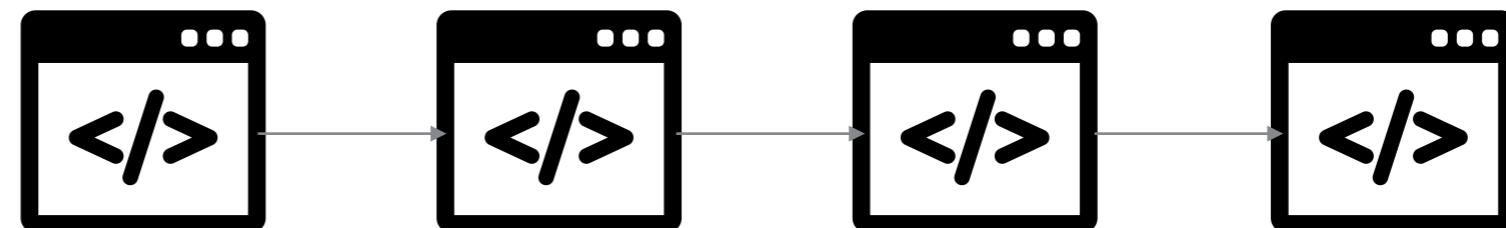

Many users

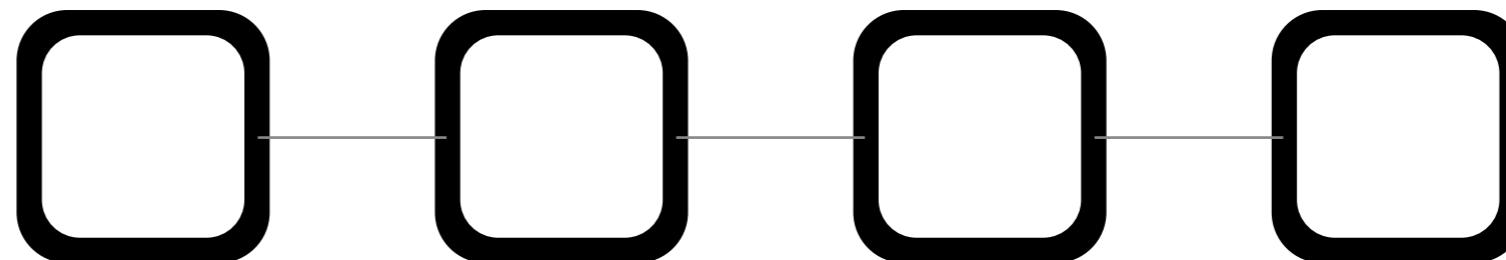

Many validators

# Blockchain Layers

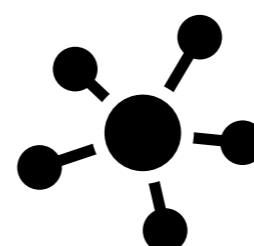

Application  
Layer 2

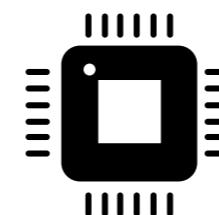

Blockchain  
Layer 1

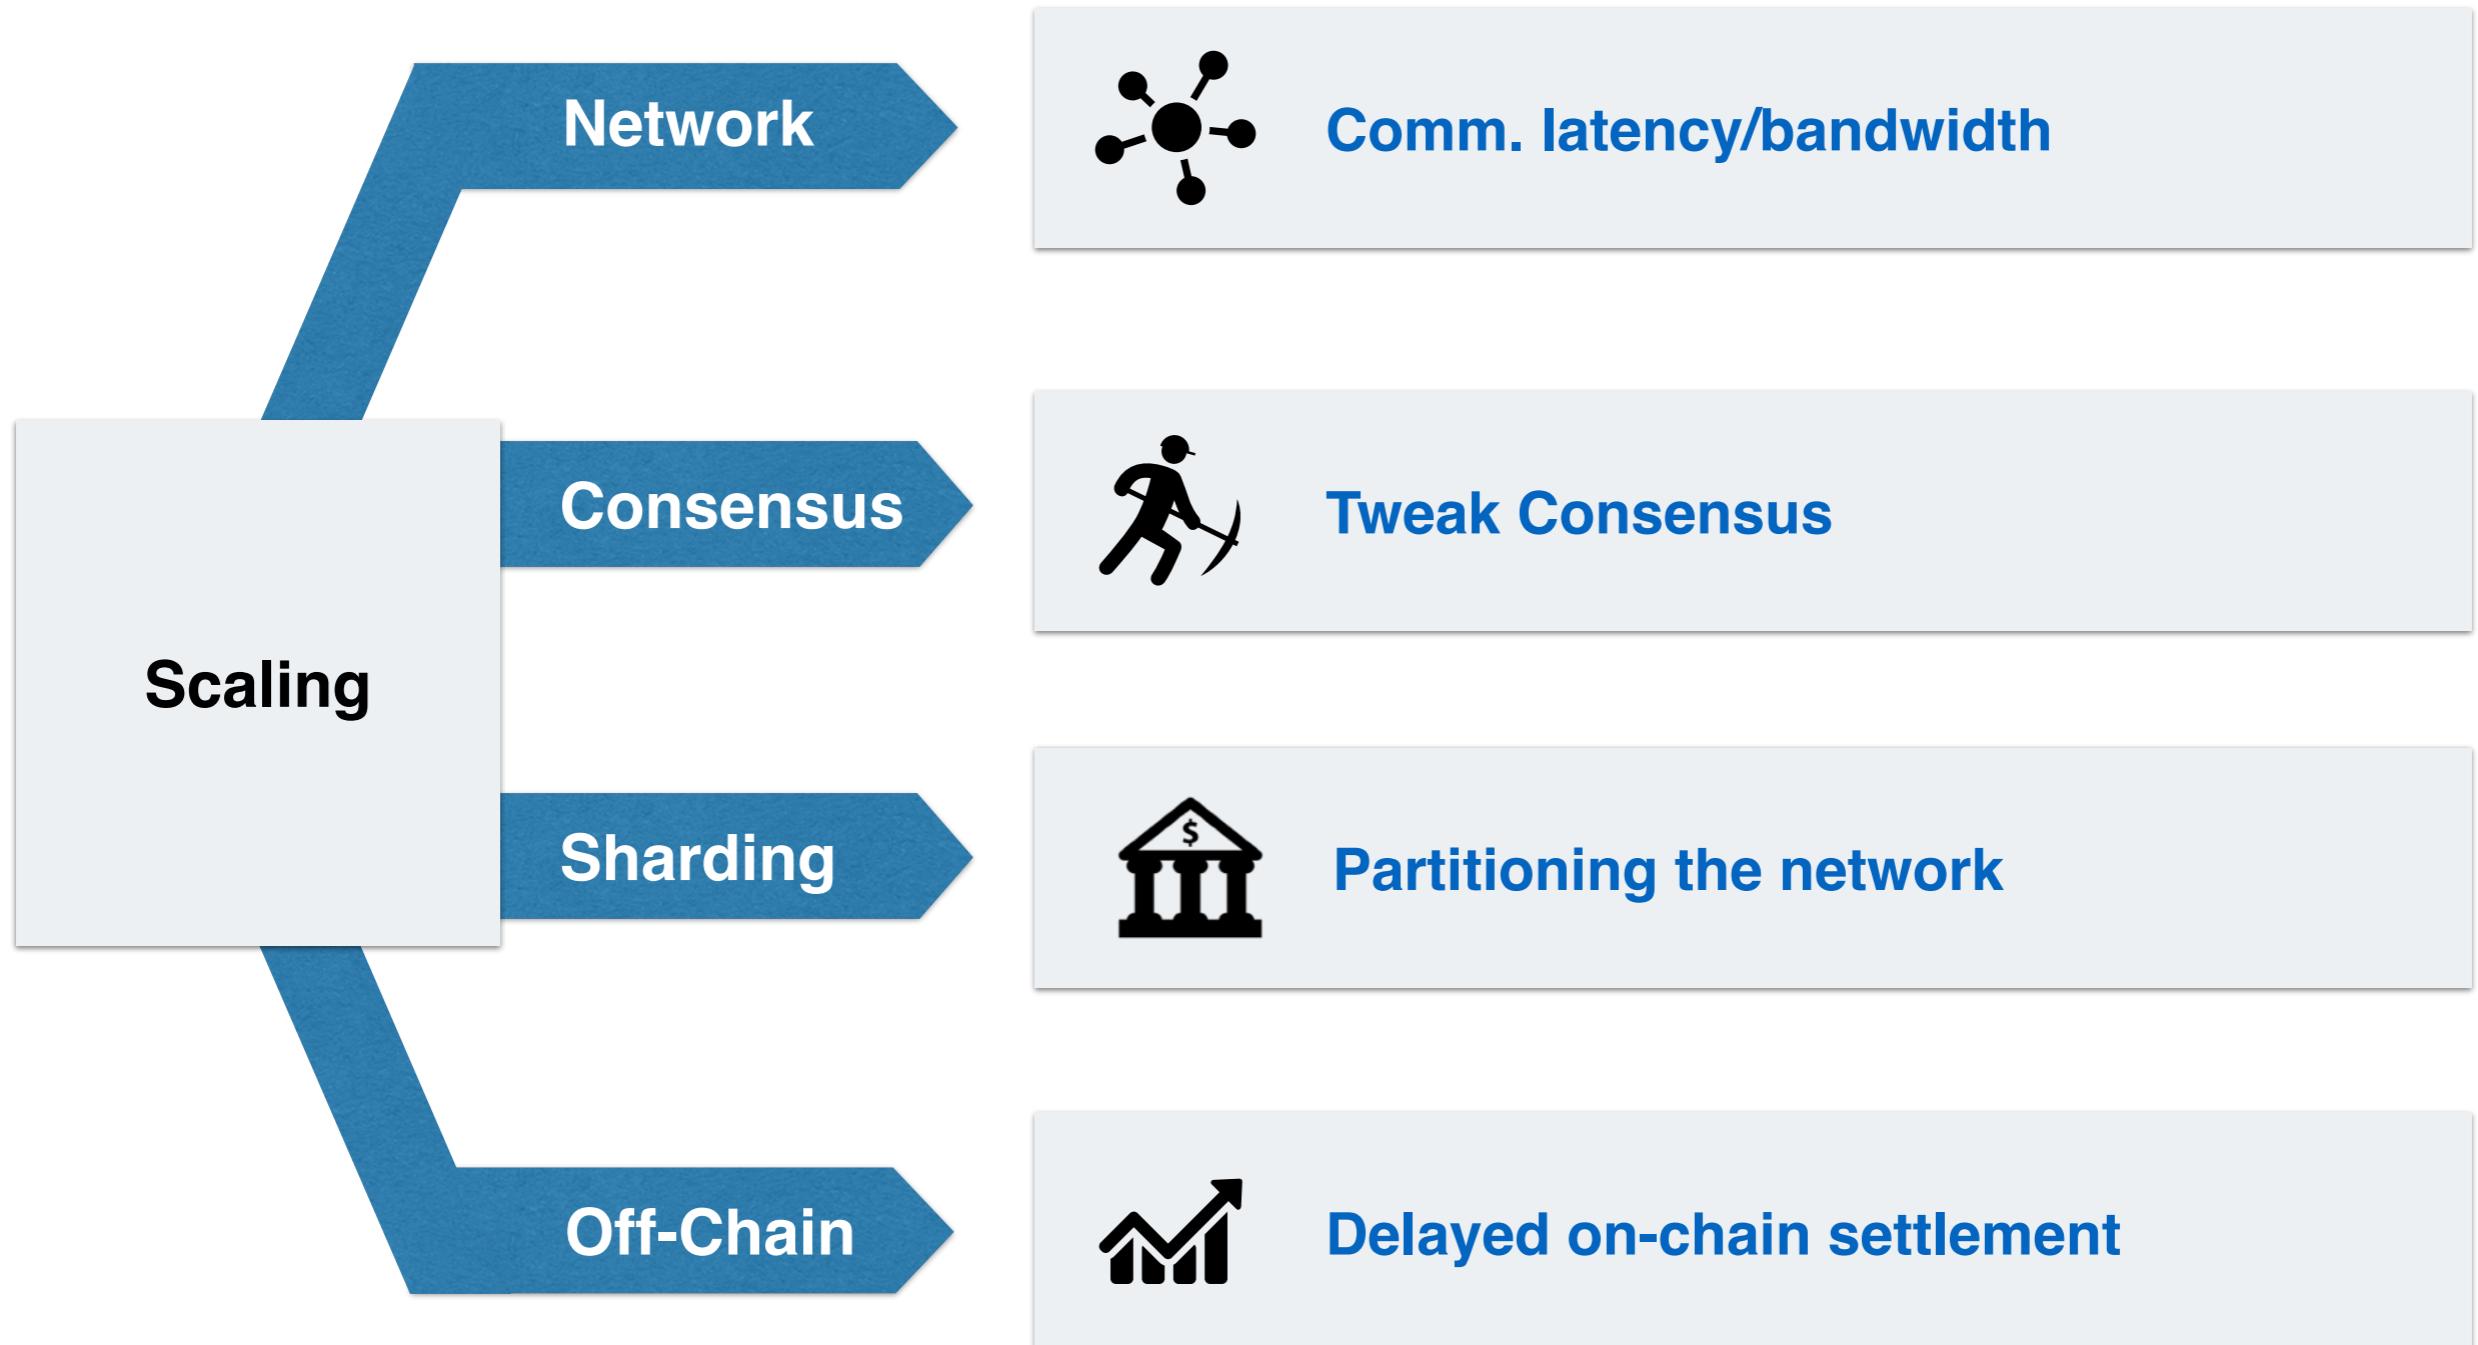

Network  
Layer 0

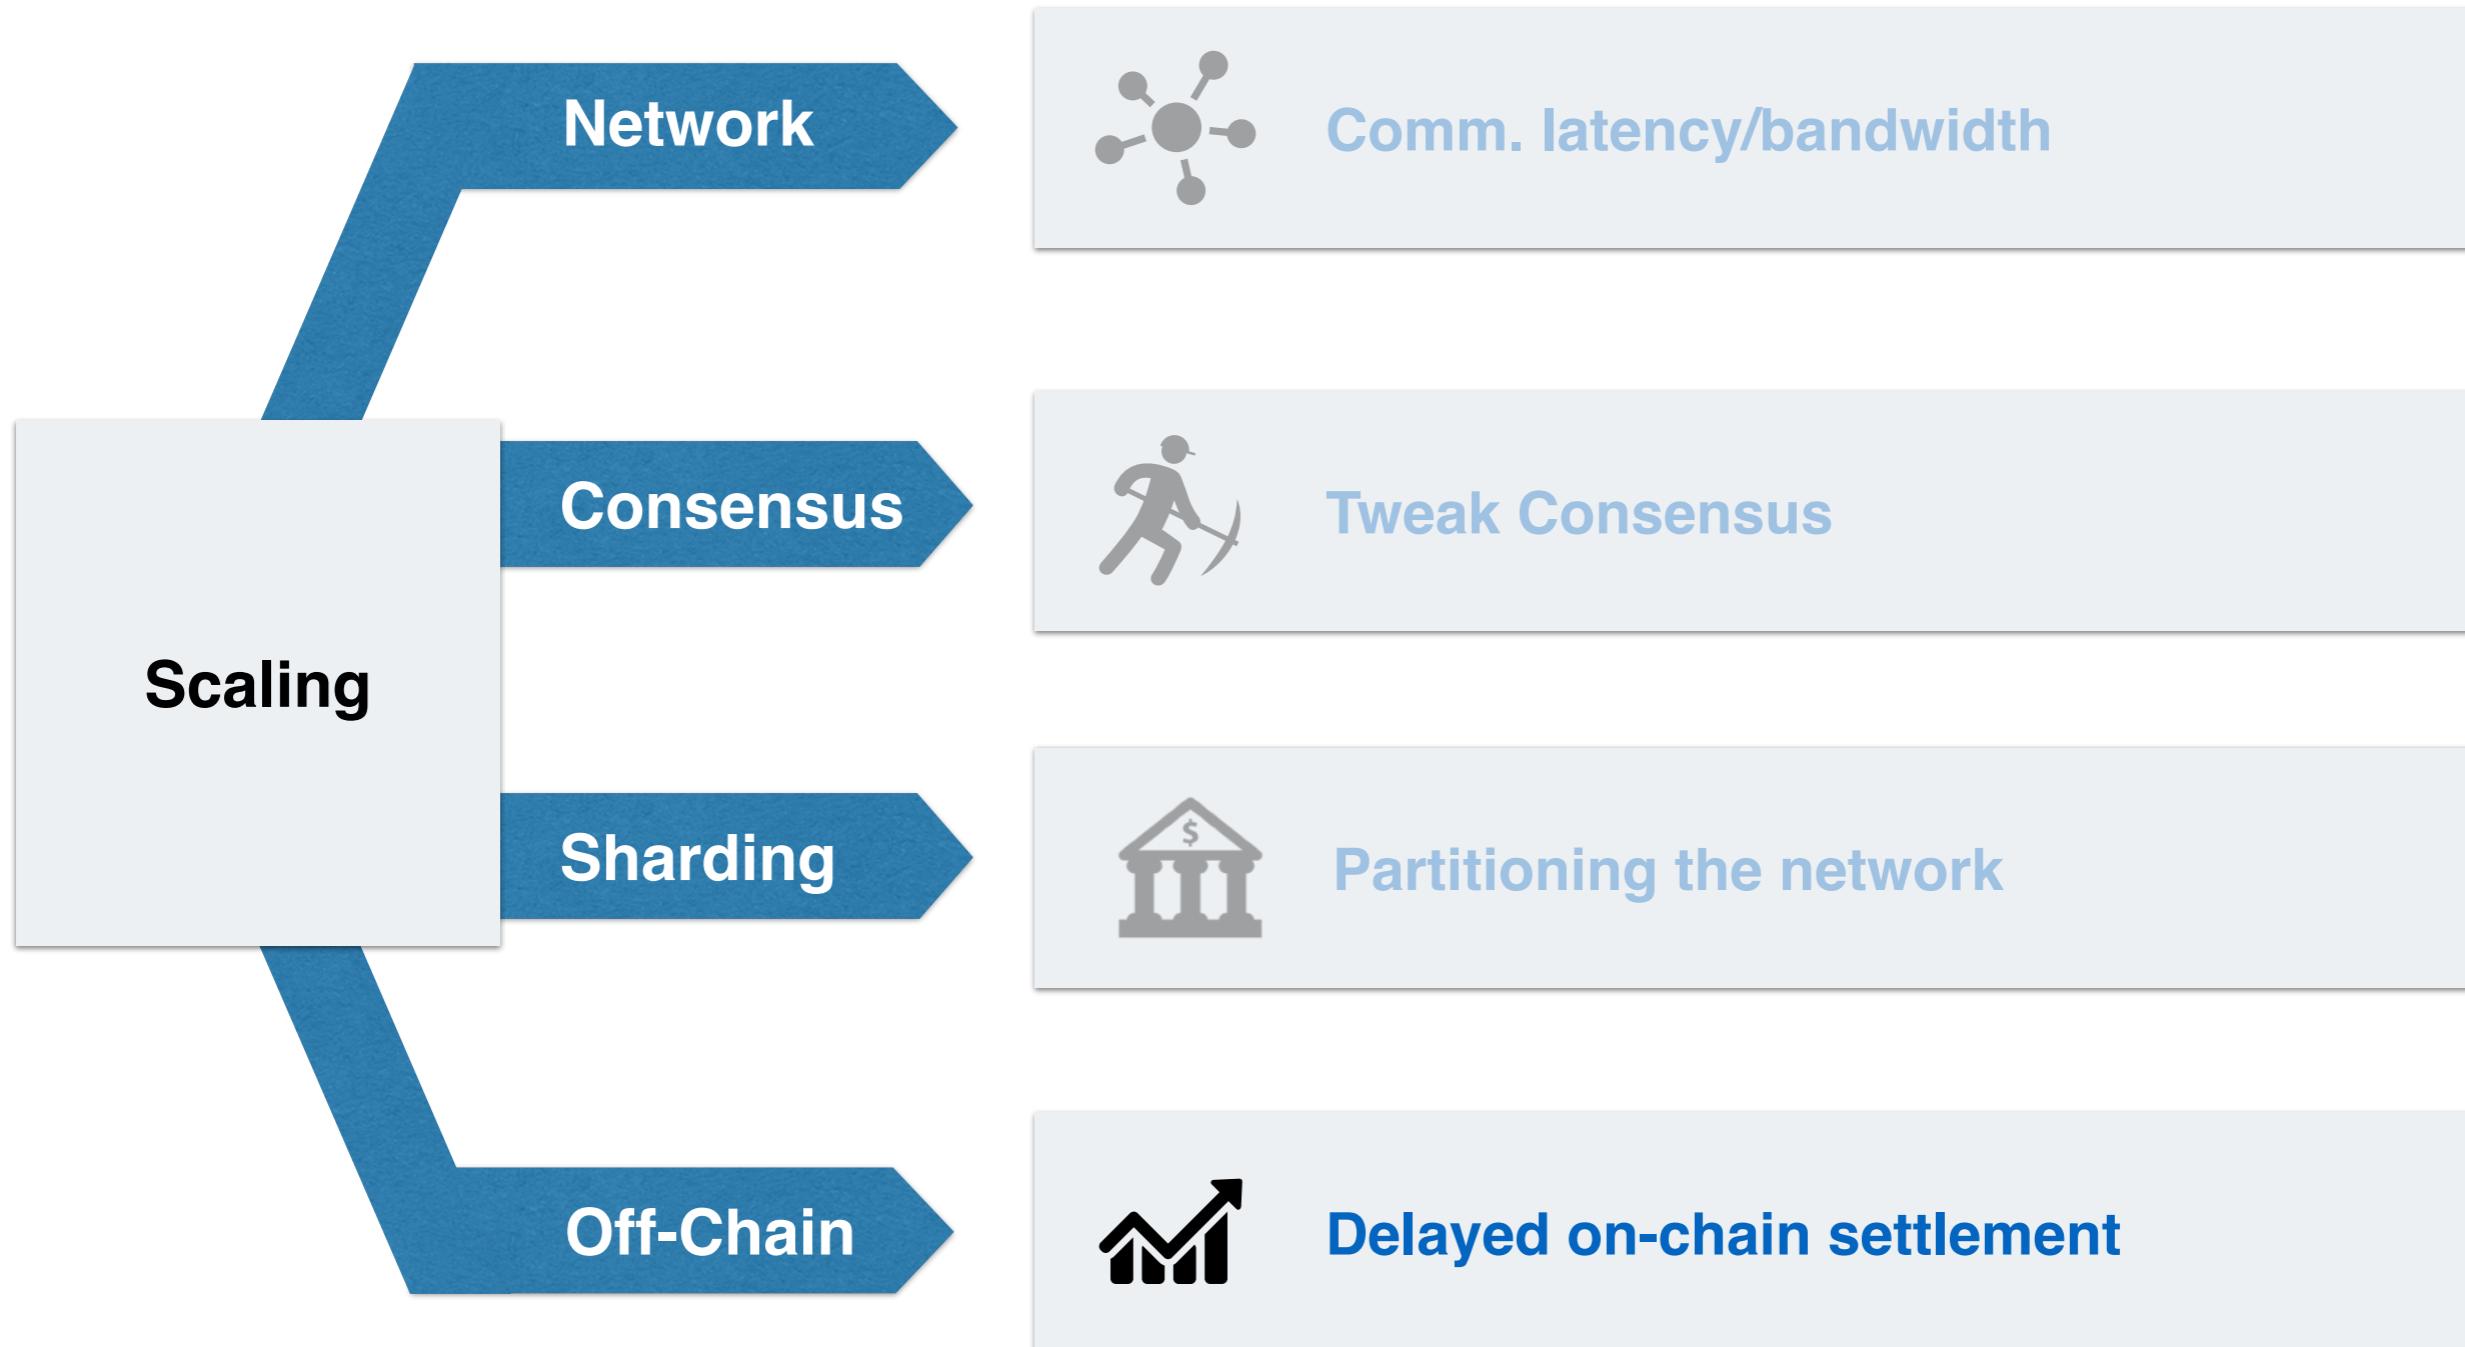

Hardware  
Layer -1

# How can we scale?

# How can we scale?

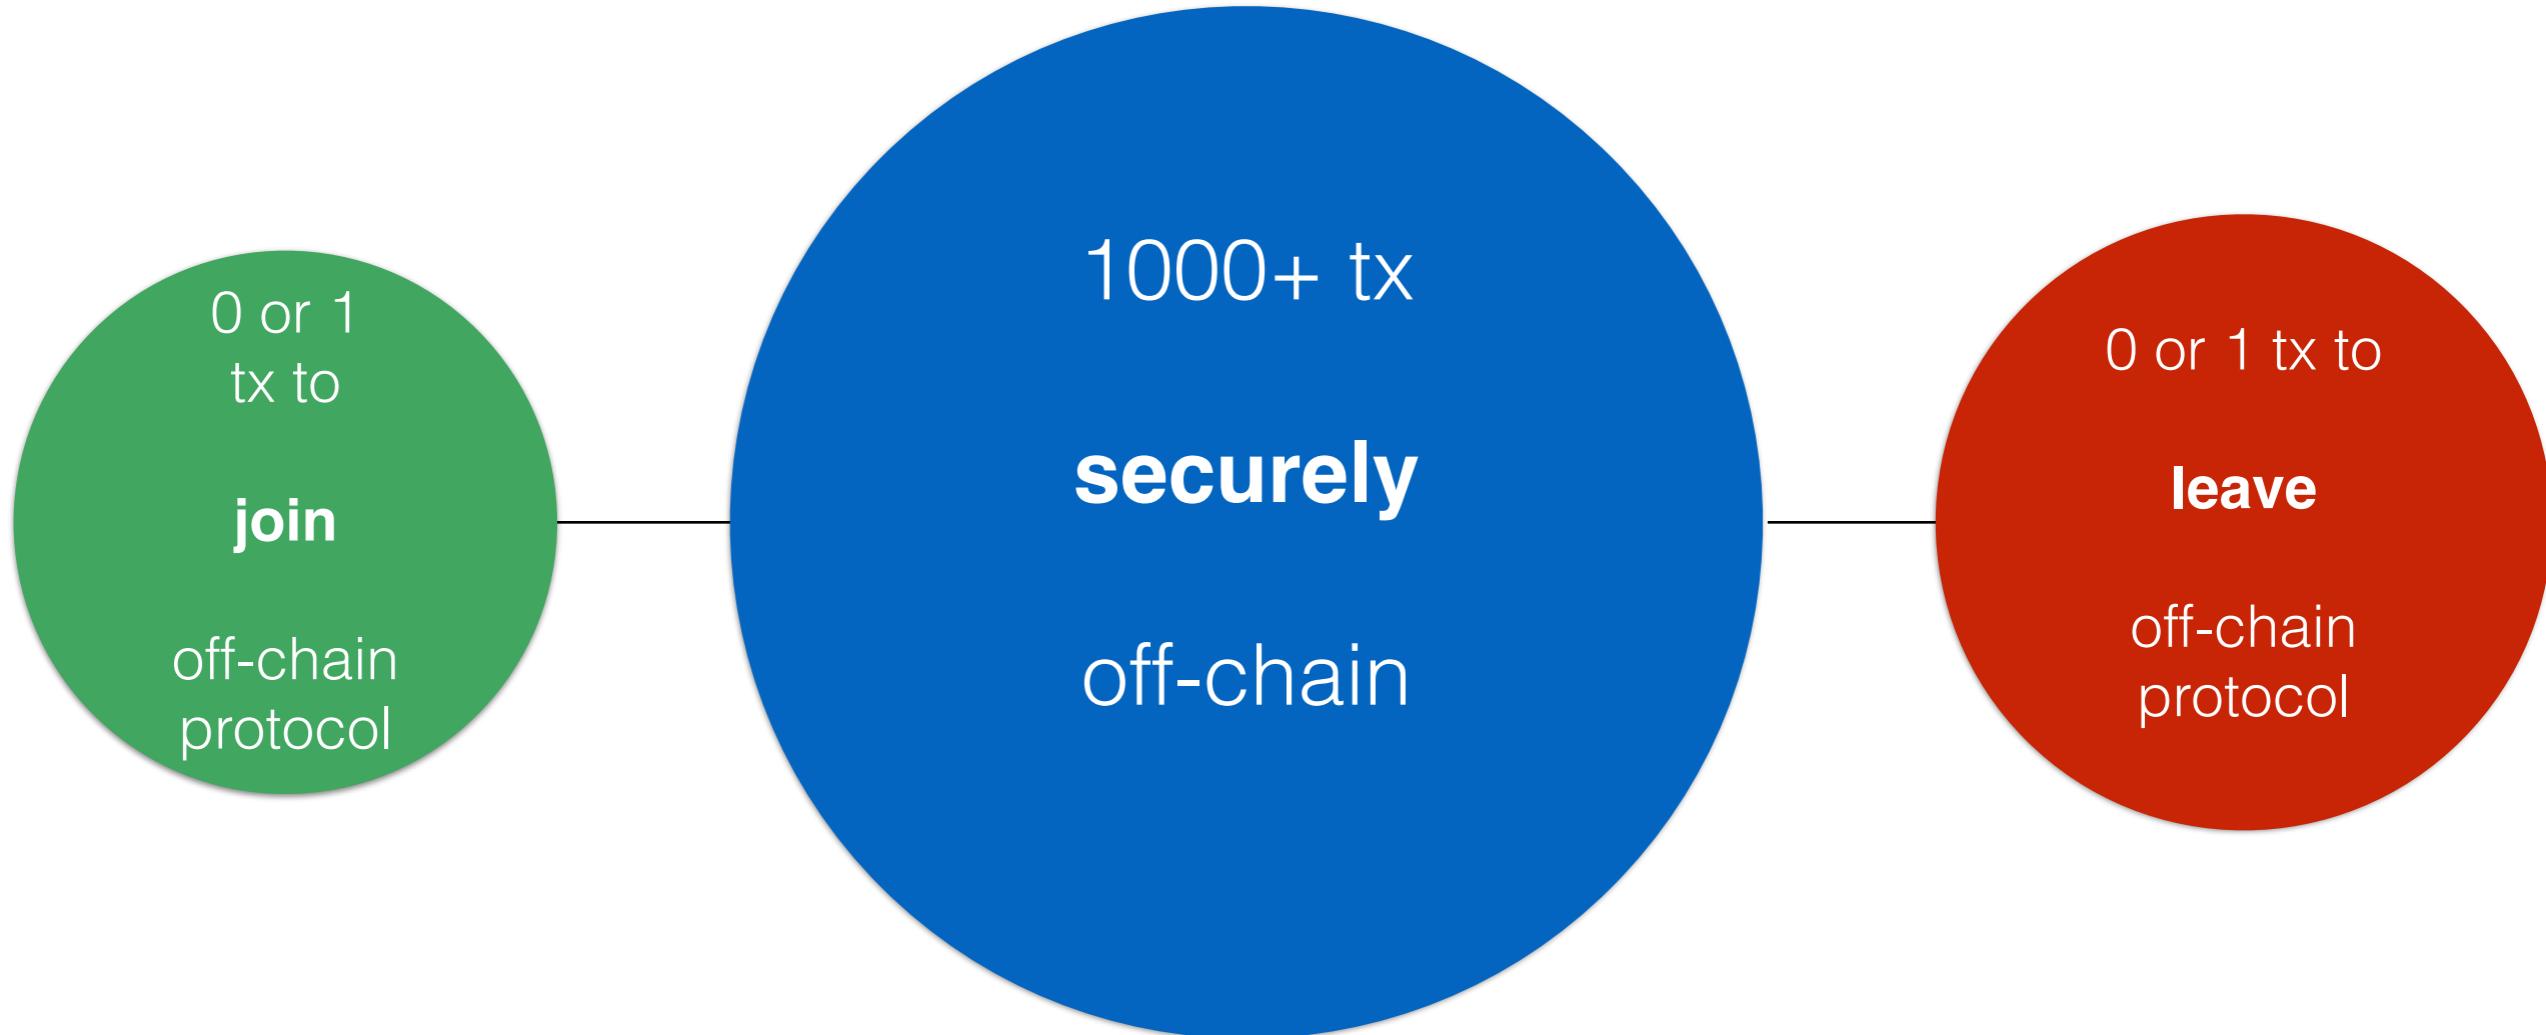

Complementary!

Off Chain Transaction ==

**Transaction outside the  
blockchain, secured *by* the  
blockchain**

# Why is Off-Chain Exciting?

**No consensus latency or mining fees,**  
while still achieving non-custodial security

**Backward compatibility!**

**Abstract**—Blockchains have the potential to revolutionize markets and services, yet, currently exhibit high latencies and fail to handle loads comparable to those managed by traditional custodian financial systems. Layer-two protocols, built on top of (layer-one) blockchains, avoid disseminating every transaction to the whole network by sending transactions *off-chain* and instead utilize the blockchain only as a recourse for disputes. The promise of layer-two protocols is to complete transactions in sub-seconds, reduce fees, and allow blockchains to scale.

With this Systematization of Knowledge, we are the first to structure the complete rich and multifaceted body of research on layer-two transactions. Categorizing the research into payment and state channels as well as commit-chains, we provide a comparison of the protocols and their properties. We contribute a systematization of the associated synchronization and routing protocols along with their privacy and security aspects. Contrary to common belief in the blockchain community, we show that layer-two can scale blockchains; that layer-two protocols are secure without full collateralization; that privacy of layer-two transaction is not granted by default; and that fees depend on the transmitted transaction value. The SoK clears the layer-two fog, highlights the potential of layer-two solutions and identifies their unsolved challenges and promising avenues of future work.

## I. INTRODUCTION

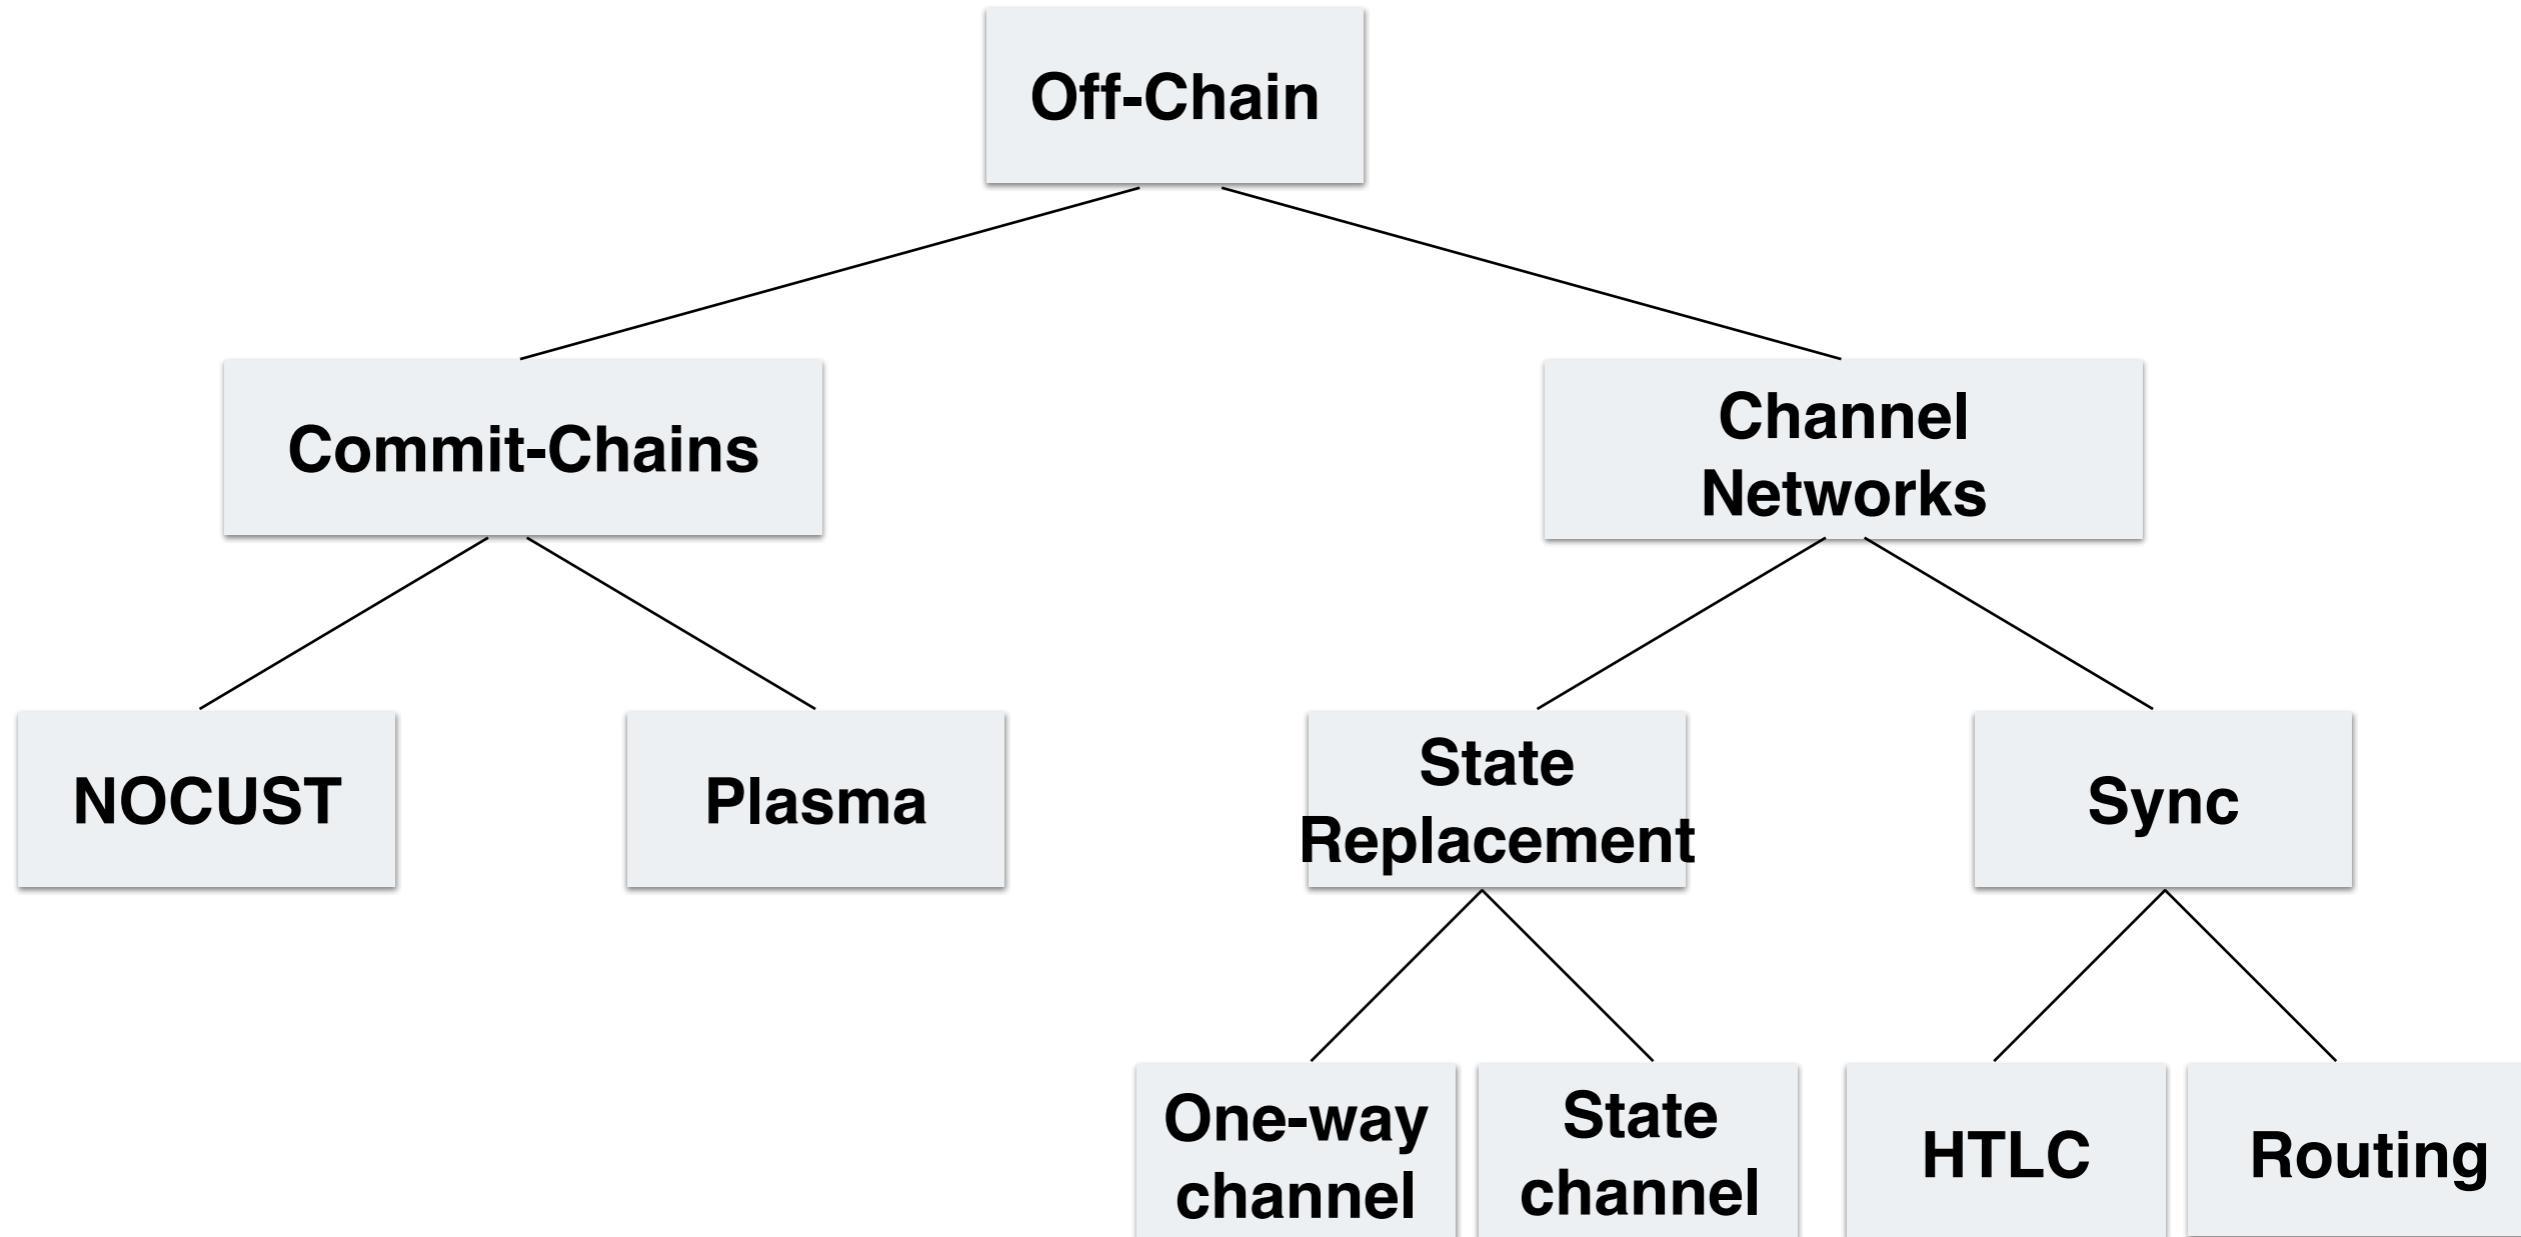

The advent of blockchains over a decade ago [1]–[4] spurred rapid and extensive innovation across different scientific disciplines. Blockchains offer a mechanism through which mutually mistrusting entities can cooperate in the absence of a trusted third party. However, the use of broadcast in those non-custodial protocols limits their scalability to about ten transactions-per-second (tps) [5], [6], compared to custodian payment systems with thousands of tps [7]. Scaling limita-

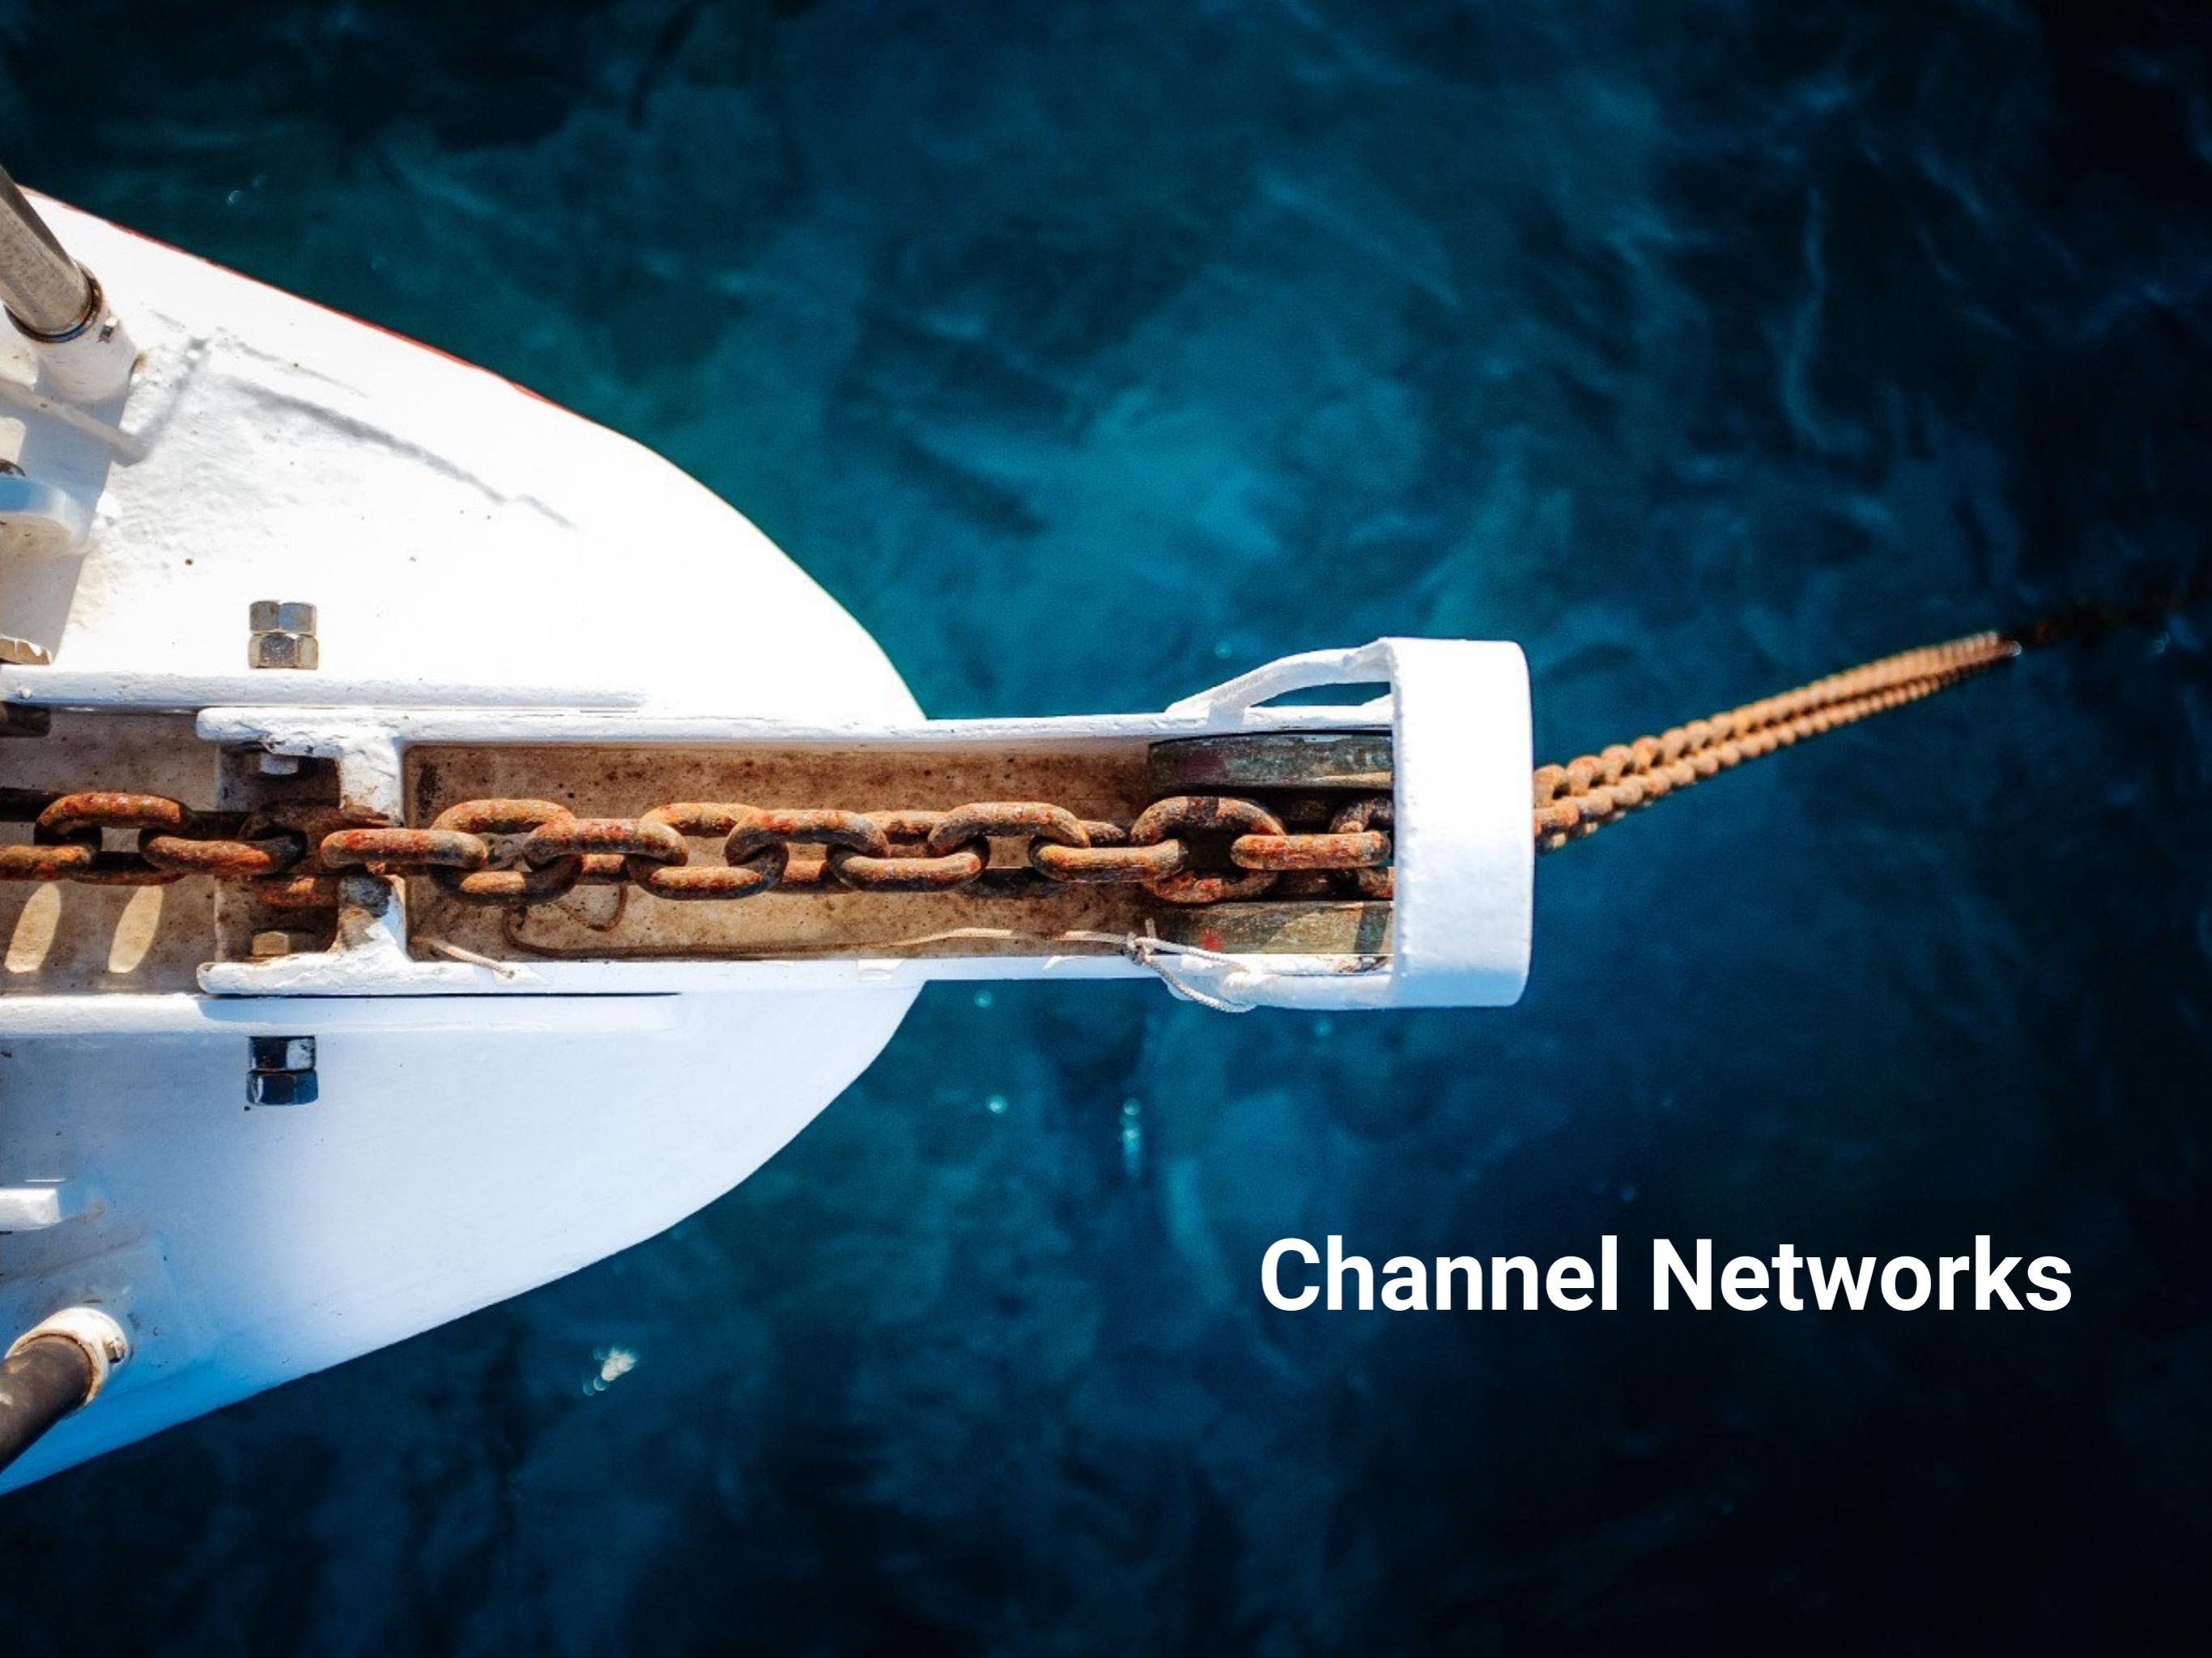

decentralized structure. Consensus changes might even lead to different, forked systems [23]. Layer-two protocols enable users to perform so-called *off-chain* transactions through private communication, rather than broadcasting the transaction on the (parent) blockchain. This optimization reduces the transaction load on the underlying blockchain and is fully backward compatible. The theoretical transaction throughput is only bounded by the communication bandwidth and latency of the involved parties. Off-chain transaction security can be guaranteed via allocated collateral, e.g. in payment channel designs [24]–[27] or by offering delayed transaction finality in commit-chain proposals [28].

### A. This Systematization of Knowledge

A rich body of literature has emerged on off-chain protocols, proposing payment [24]–[27], [29], state [30] and virtual [31] channels, payment channel networks (PCNs) [27], [29] and related routing protocols [32]–[37], channel rebalancing [38] and channel factories [39] constructions, commit-chains [28], [40], channel hubs [41], [42], privacy-enhancing channels [41], [43]–[45]. However, the sources of information about layer-two protocols are highly disparate. Moreover, in part due to the rapid pace of advancement in the blockchain field, we observe, mostly outside academia, a frequent under-specification of constructions and their adversarial assumptions. This makes it exceedingly difficult to discern thought-through concepts from marketing activities. We aim to clear the fog surrounding layer-two protocols, equipping newcomers to this inaccessible field with a concise reference, and inform the directions of future

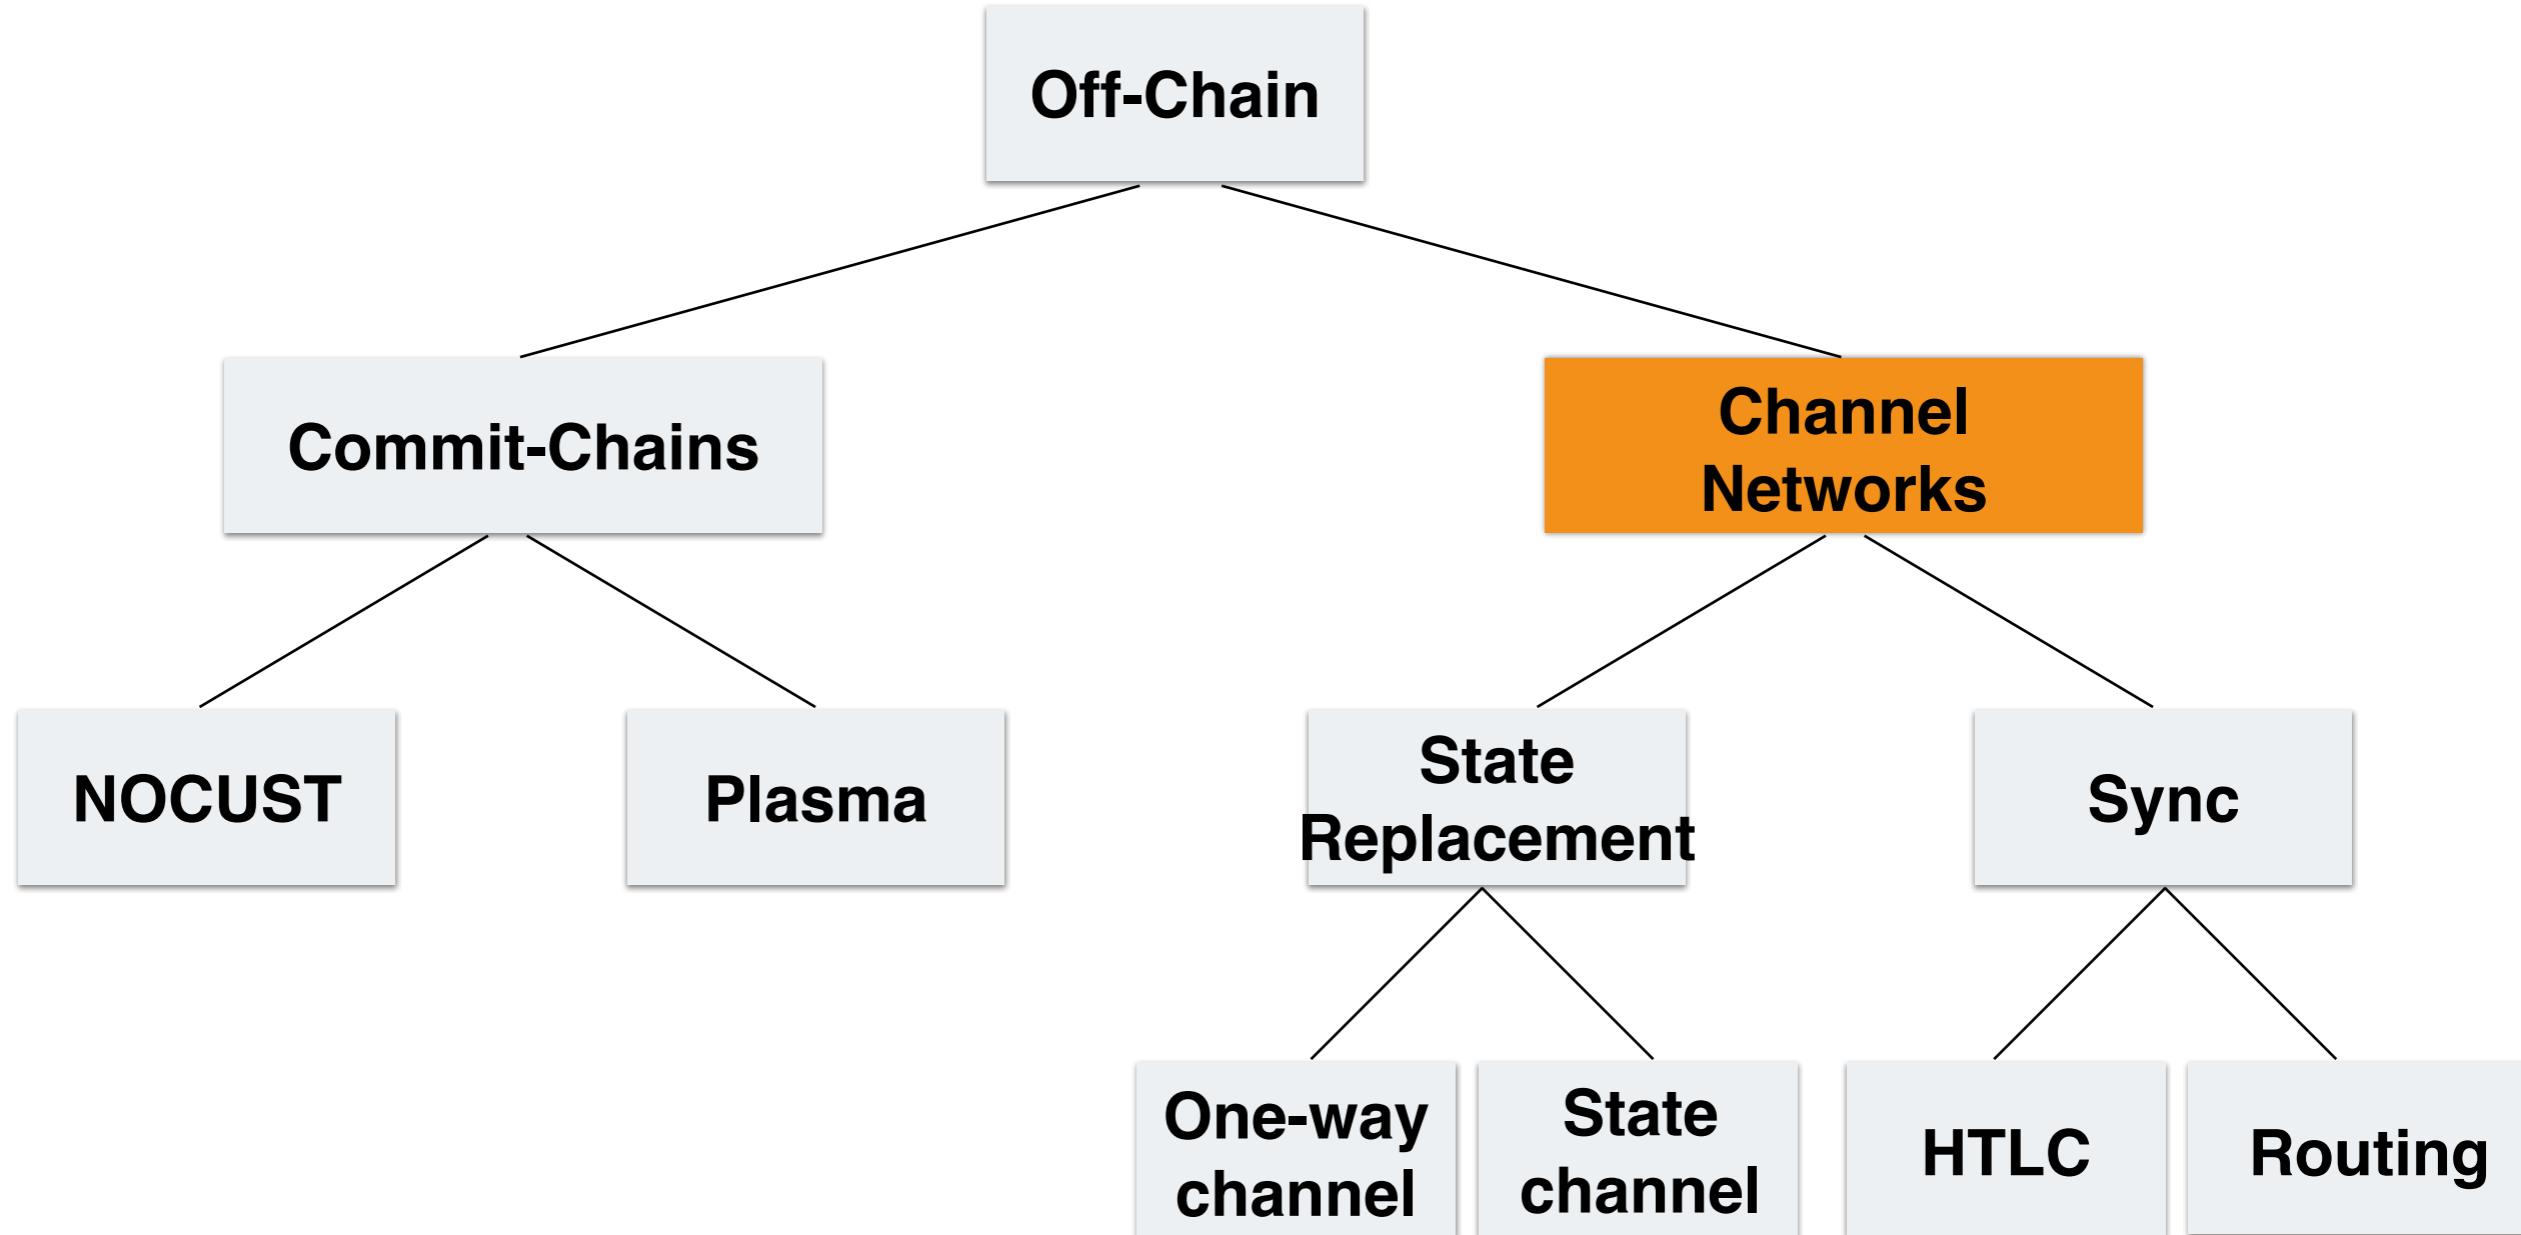

# Which Off-Chain Solution?

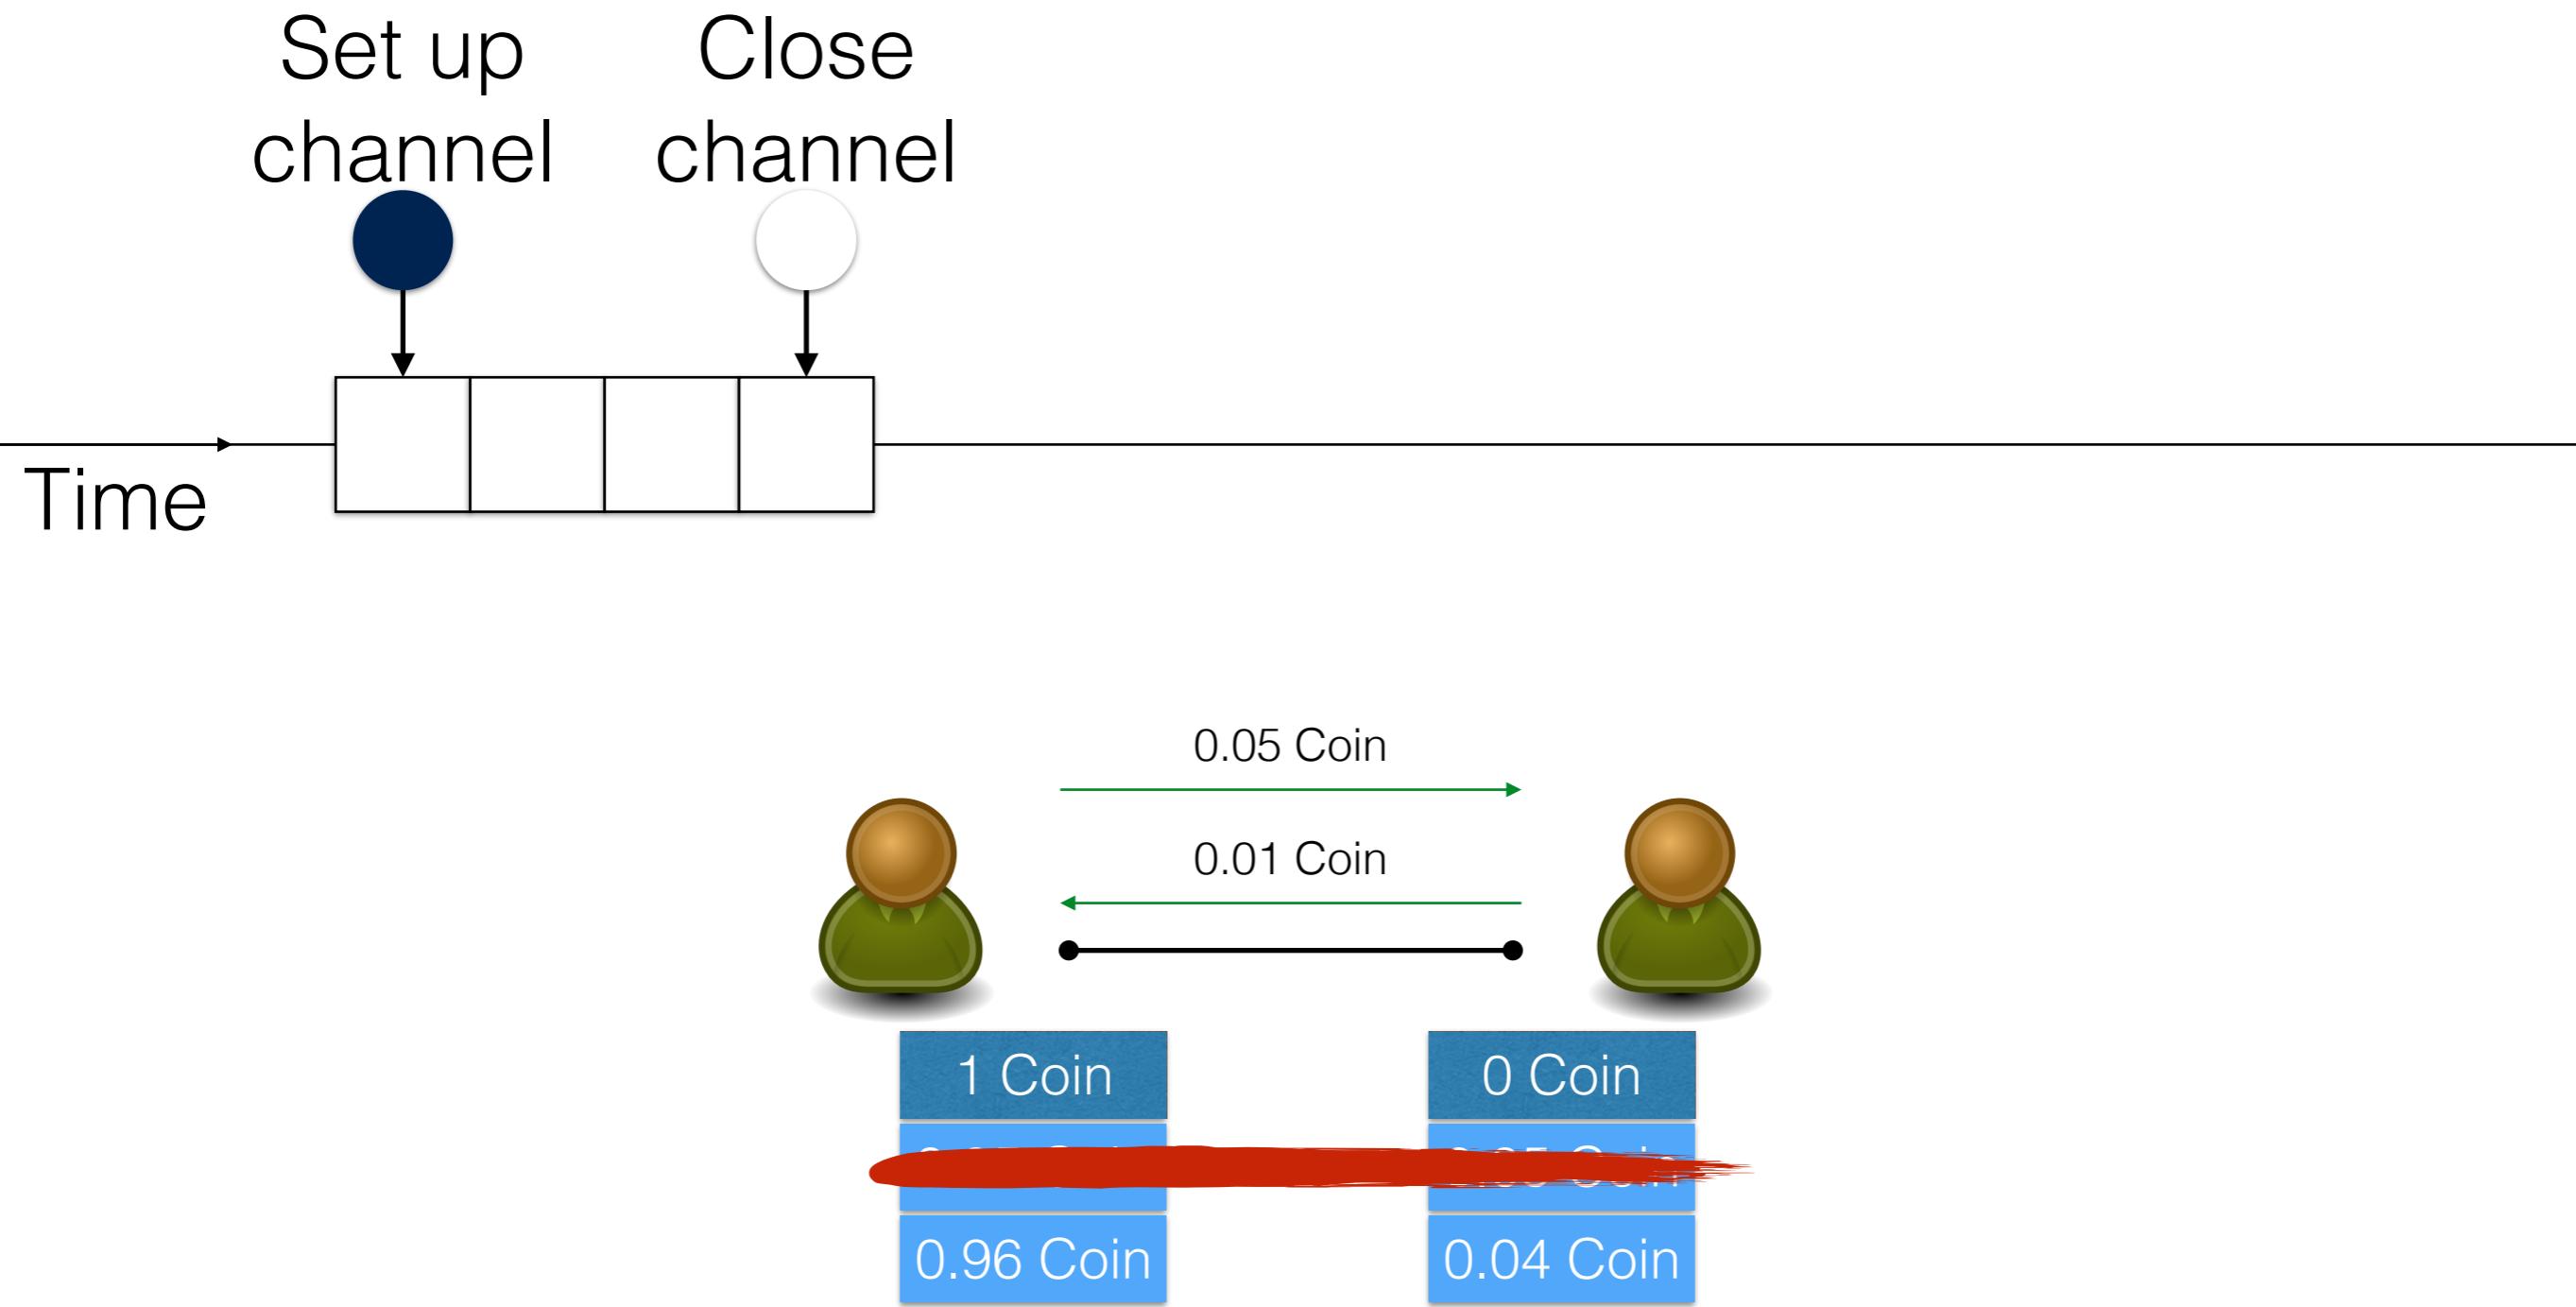

A close-up photograph of a white boat's bow and anchor chain against a dark blue sea. The boat's white hull is visible on the left, featuring a metal cleat and a anchor chain. A thick, weathered anchor chain runs across the frame. The water is a deep, dark blue.

# Channel Networks

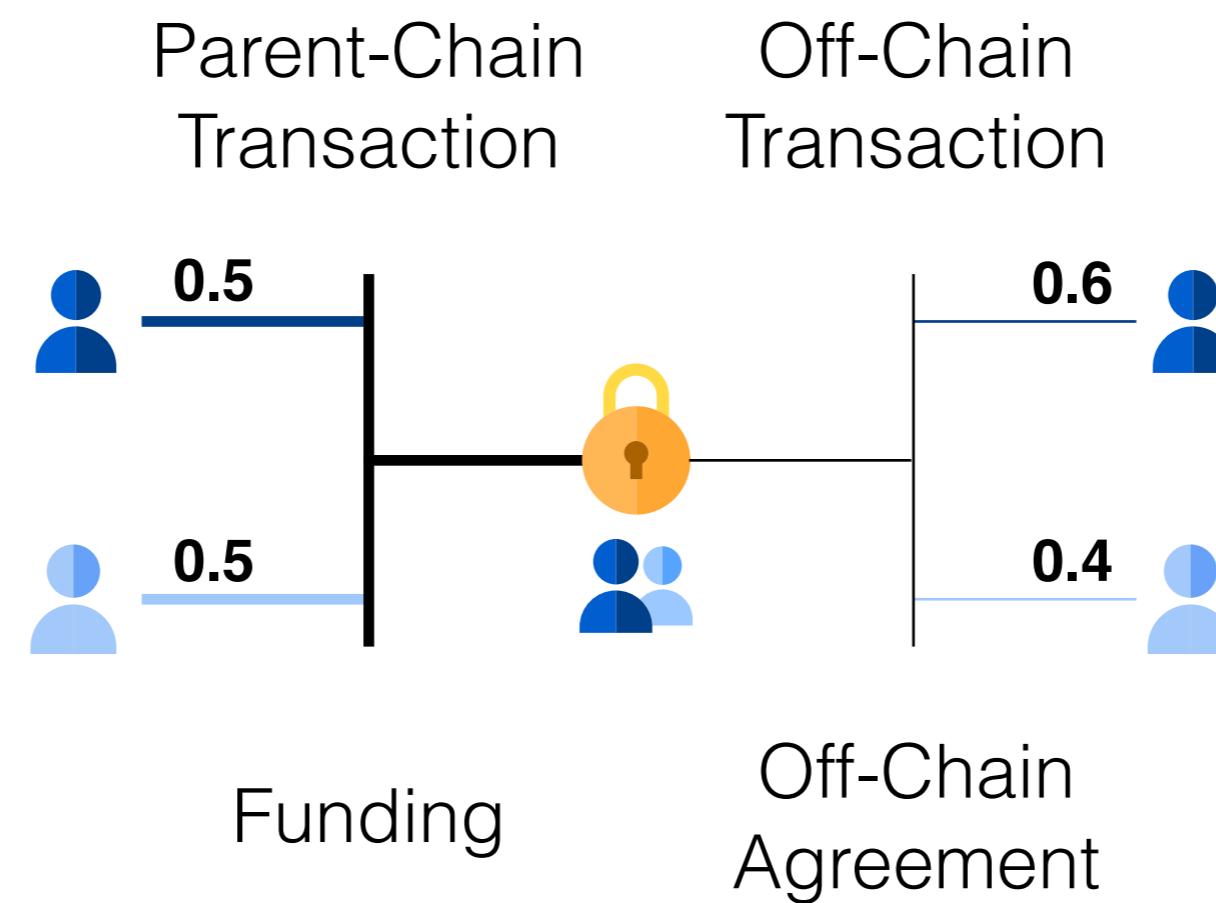

# Which Off-Chain Solution?

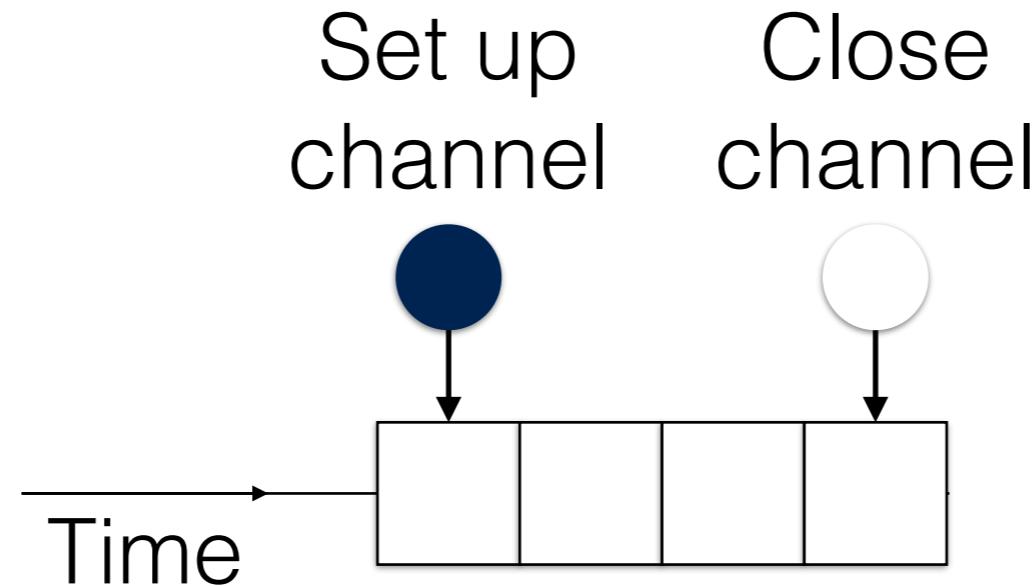

# Payment Channel

# Payment Channel

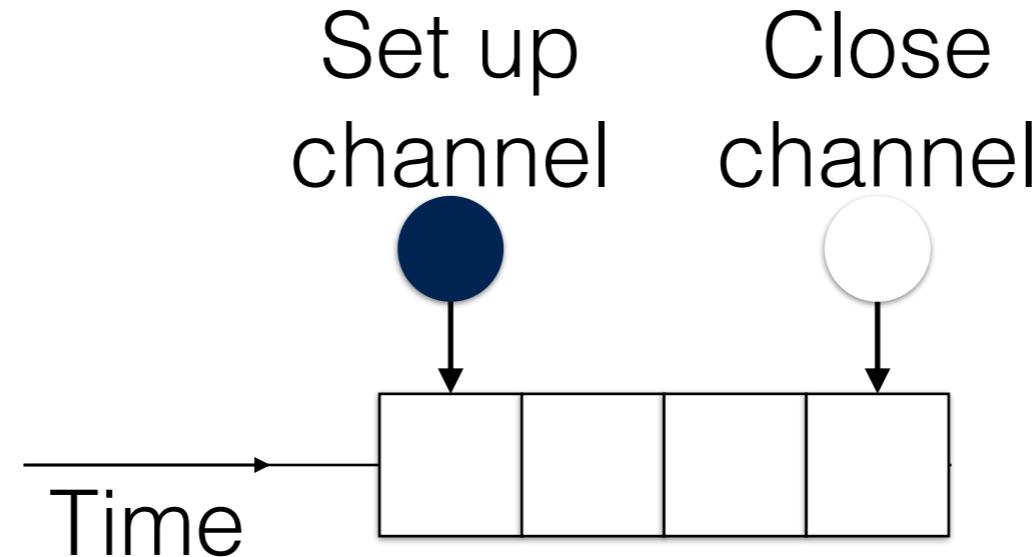

# Payment Channel Properties

- **Balance Security:**  
Any party can always withdraw the agreed balance on-chain with a dispute.
- **State Progression:**  
Any party can enforce a state transition on-chain to reach a terminal state.

# Payment Channel

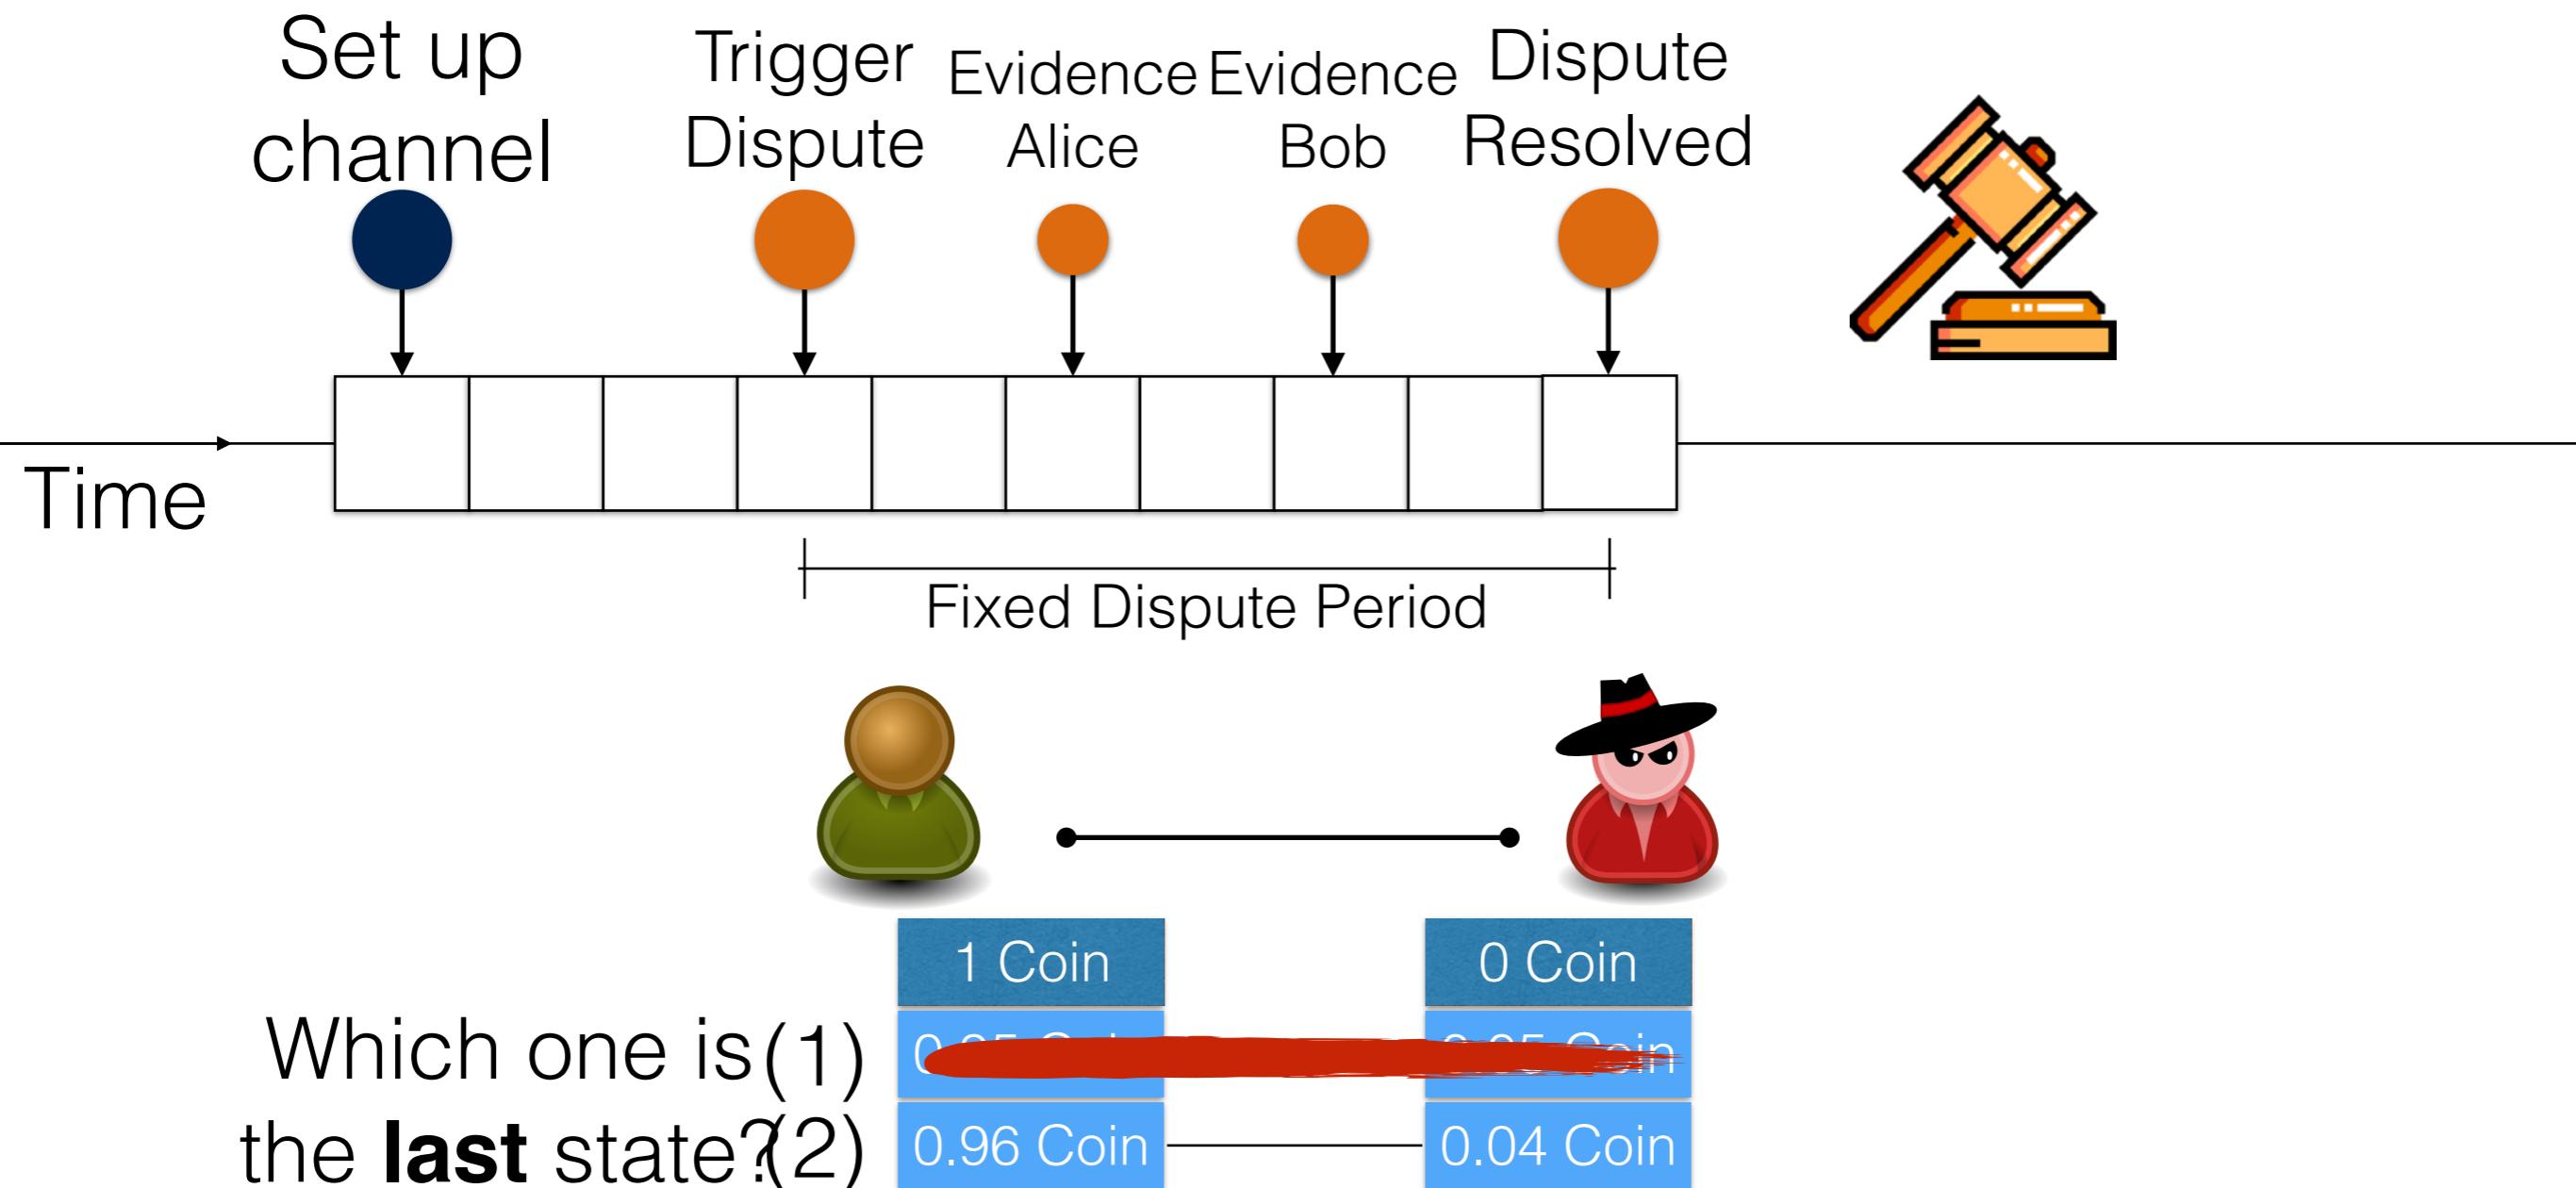

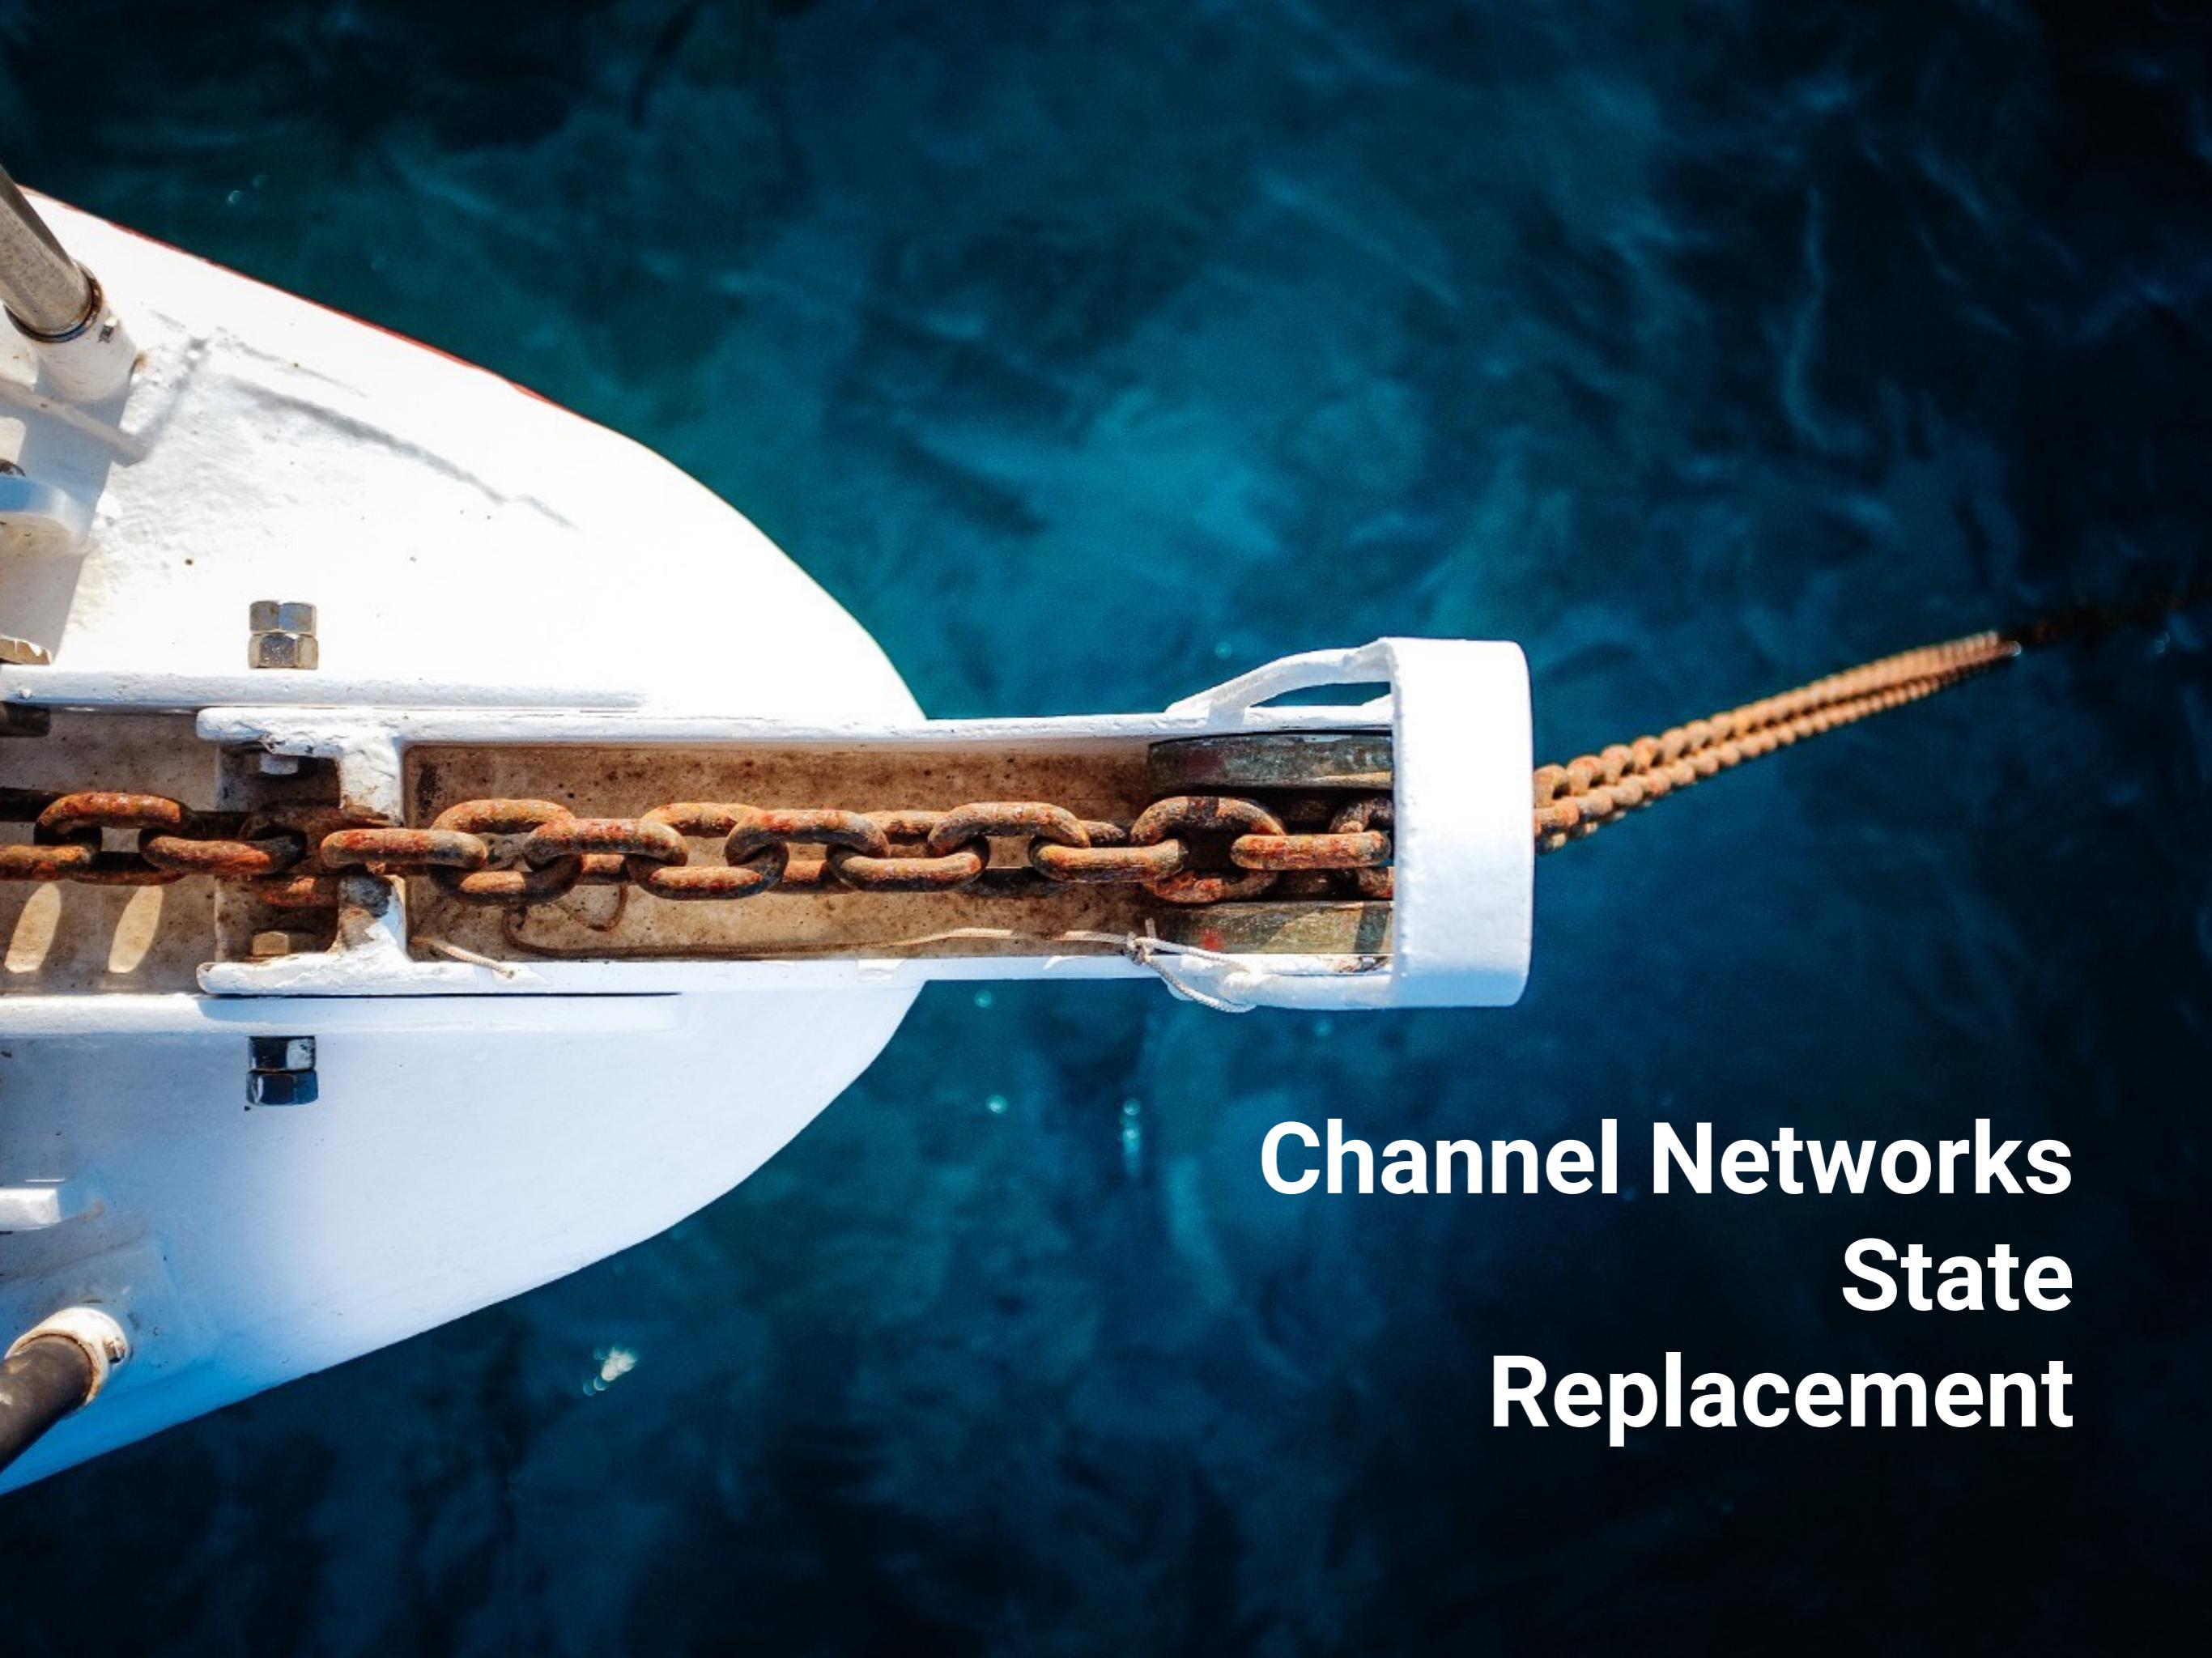

- Unanimous Establishment
- Unanimous Transition (without dispute)

**What if the parties do not agree?**

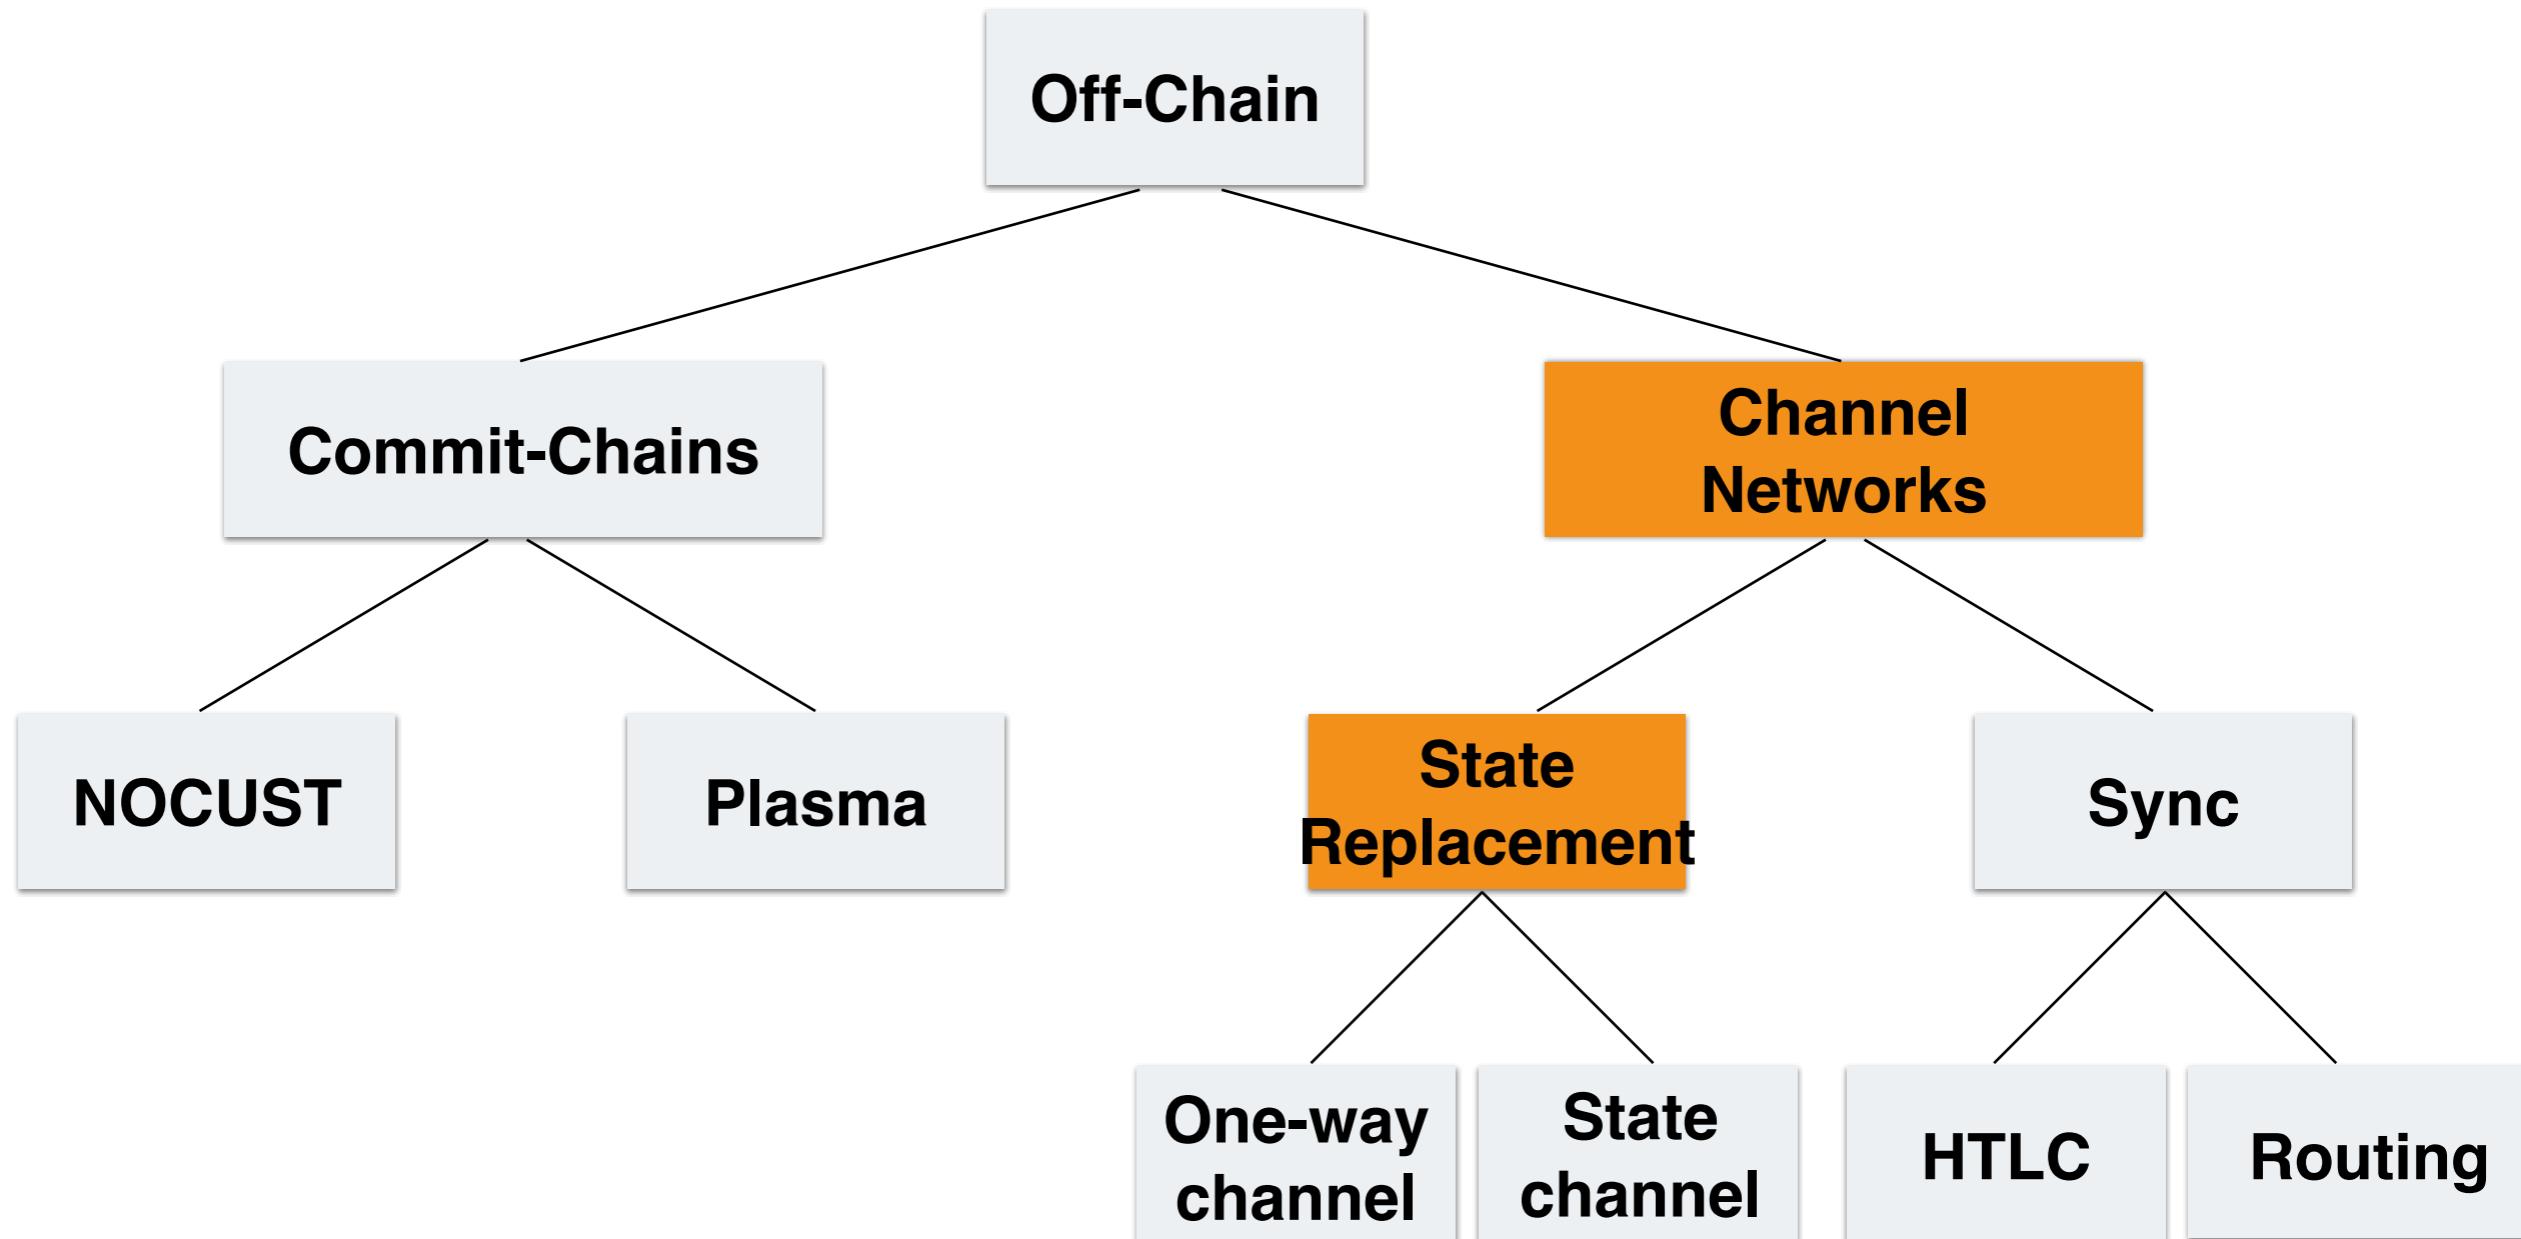

# Payment Channel - Dispute

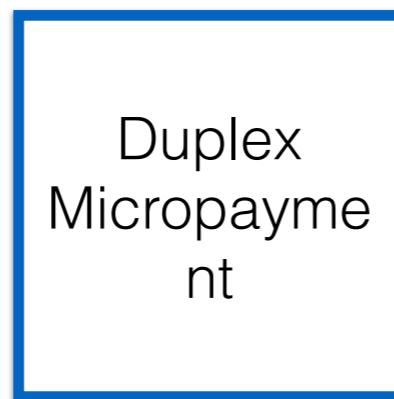

# Channel Networks State Replacement

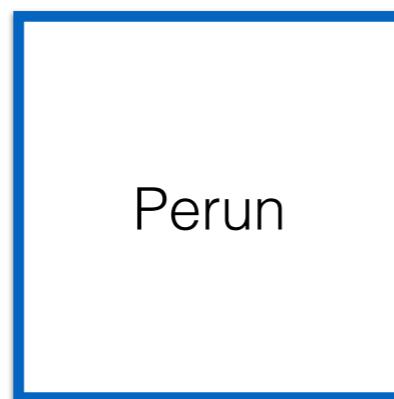

# Which Off-Chain Solution?

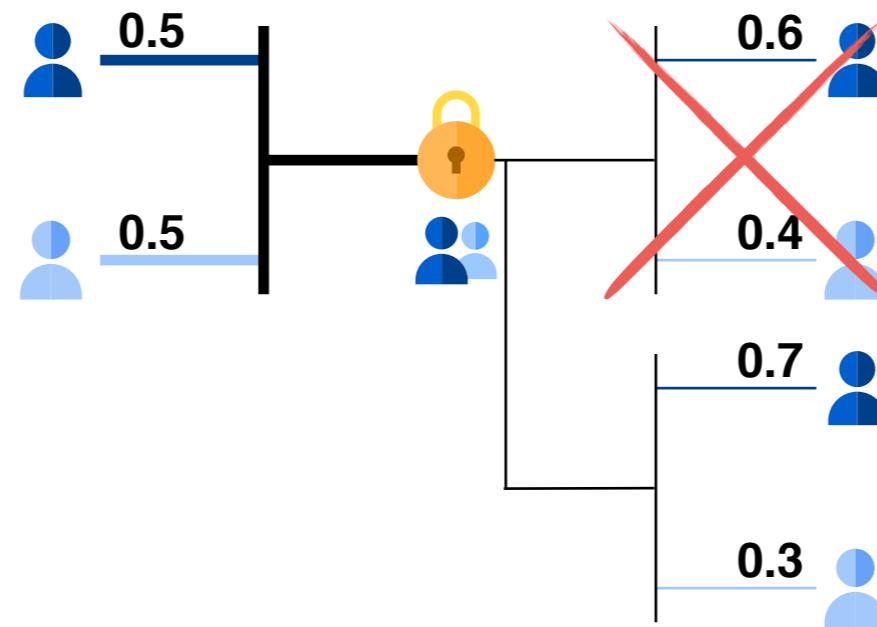

## **Payment Channel (redistribution of assets)**

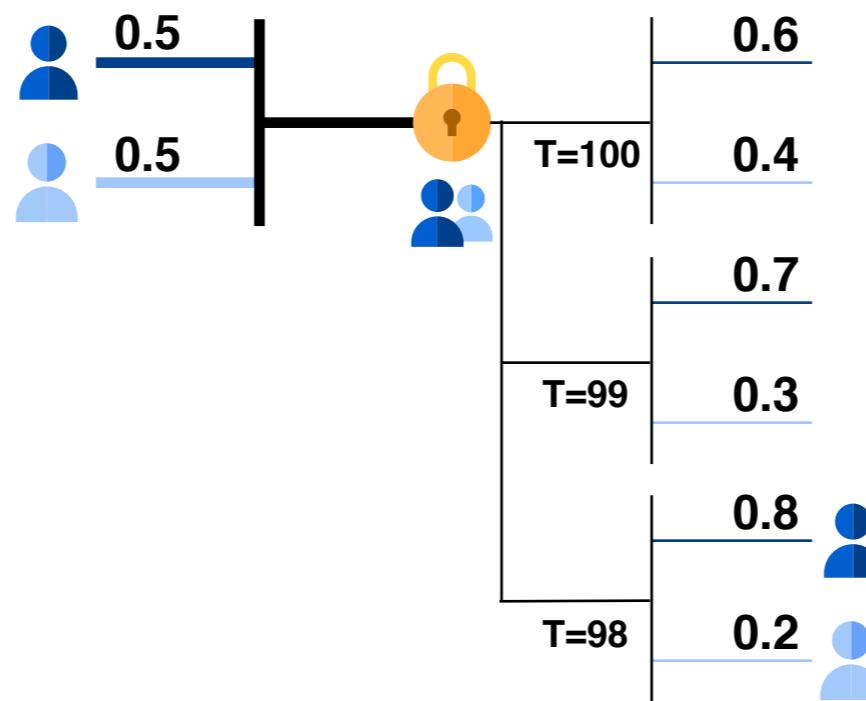

## **State Channel (game, voting, auctions, etc)**

# State Replacement

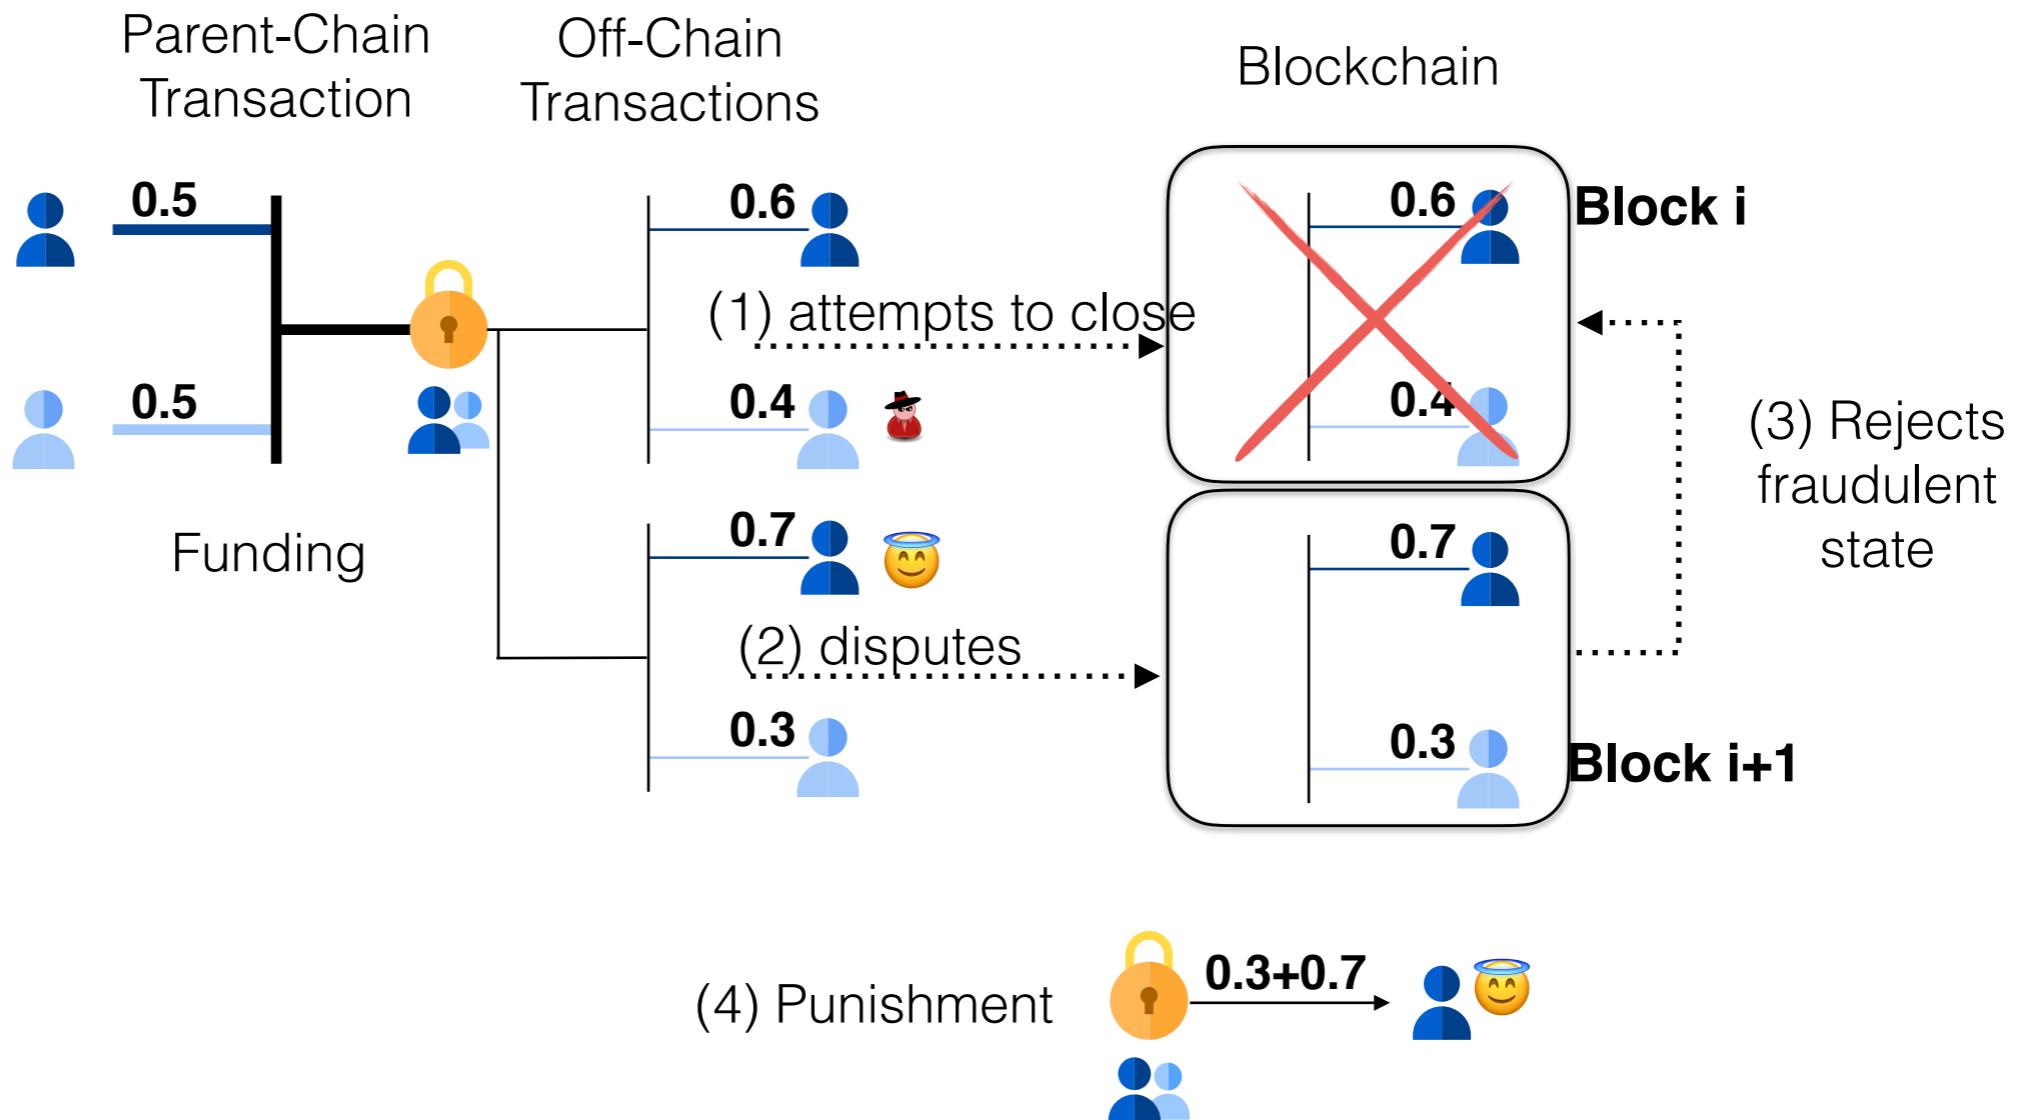

# Time Lock State Replacement

Lowest timelock is first included in the blockchain.

# Revocation State Replacement (Lightning)

# State Replacement Techniques (2013 - 2015)

Replace by..

## Incentive

Spilman

## One-way payments

Receiver signs and publishes final statement

## Time Lock

Duplex Micropayment Channels

## Bi-directional

Tension between throughput and on-chain costs  
Expiry time (later removed)

## Revocation

Lightning

## Bi-directional, no expiry

Agree on last state, keep all previous revoked states

Protocol  
Complexity

A thick black downward-pointing arrow indicating a progression or flow from the original techniques to the final one.

Bitcoin's model makes it challenging to remove expiry time and throughput limitations

# State Replacement Techniques (2016+)

Replace by..

**Version** →

**State change, everyone signs**

Increment version

Sig(A), Sig(B), Hash of State(i), i

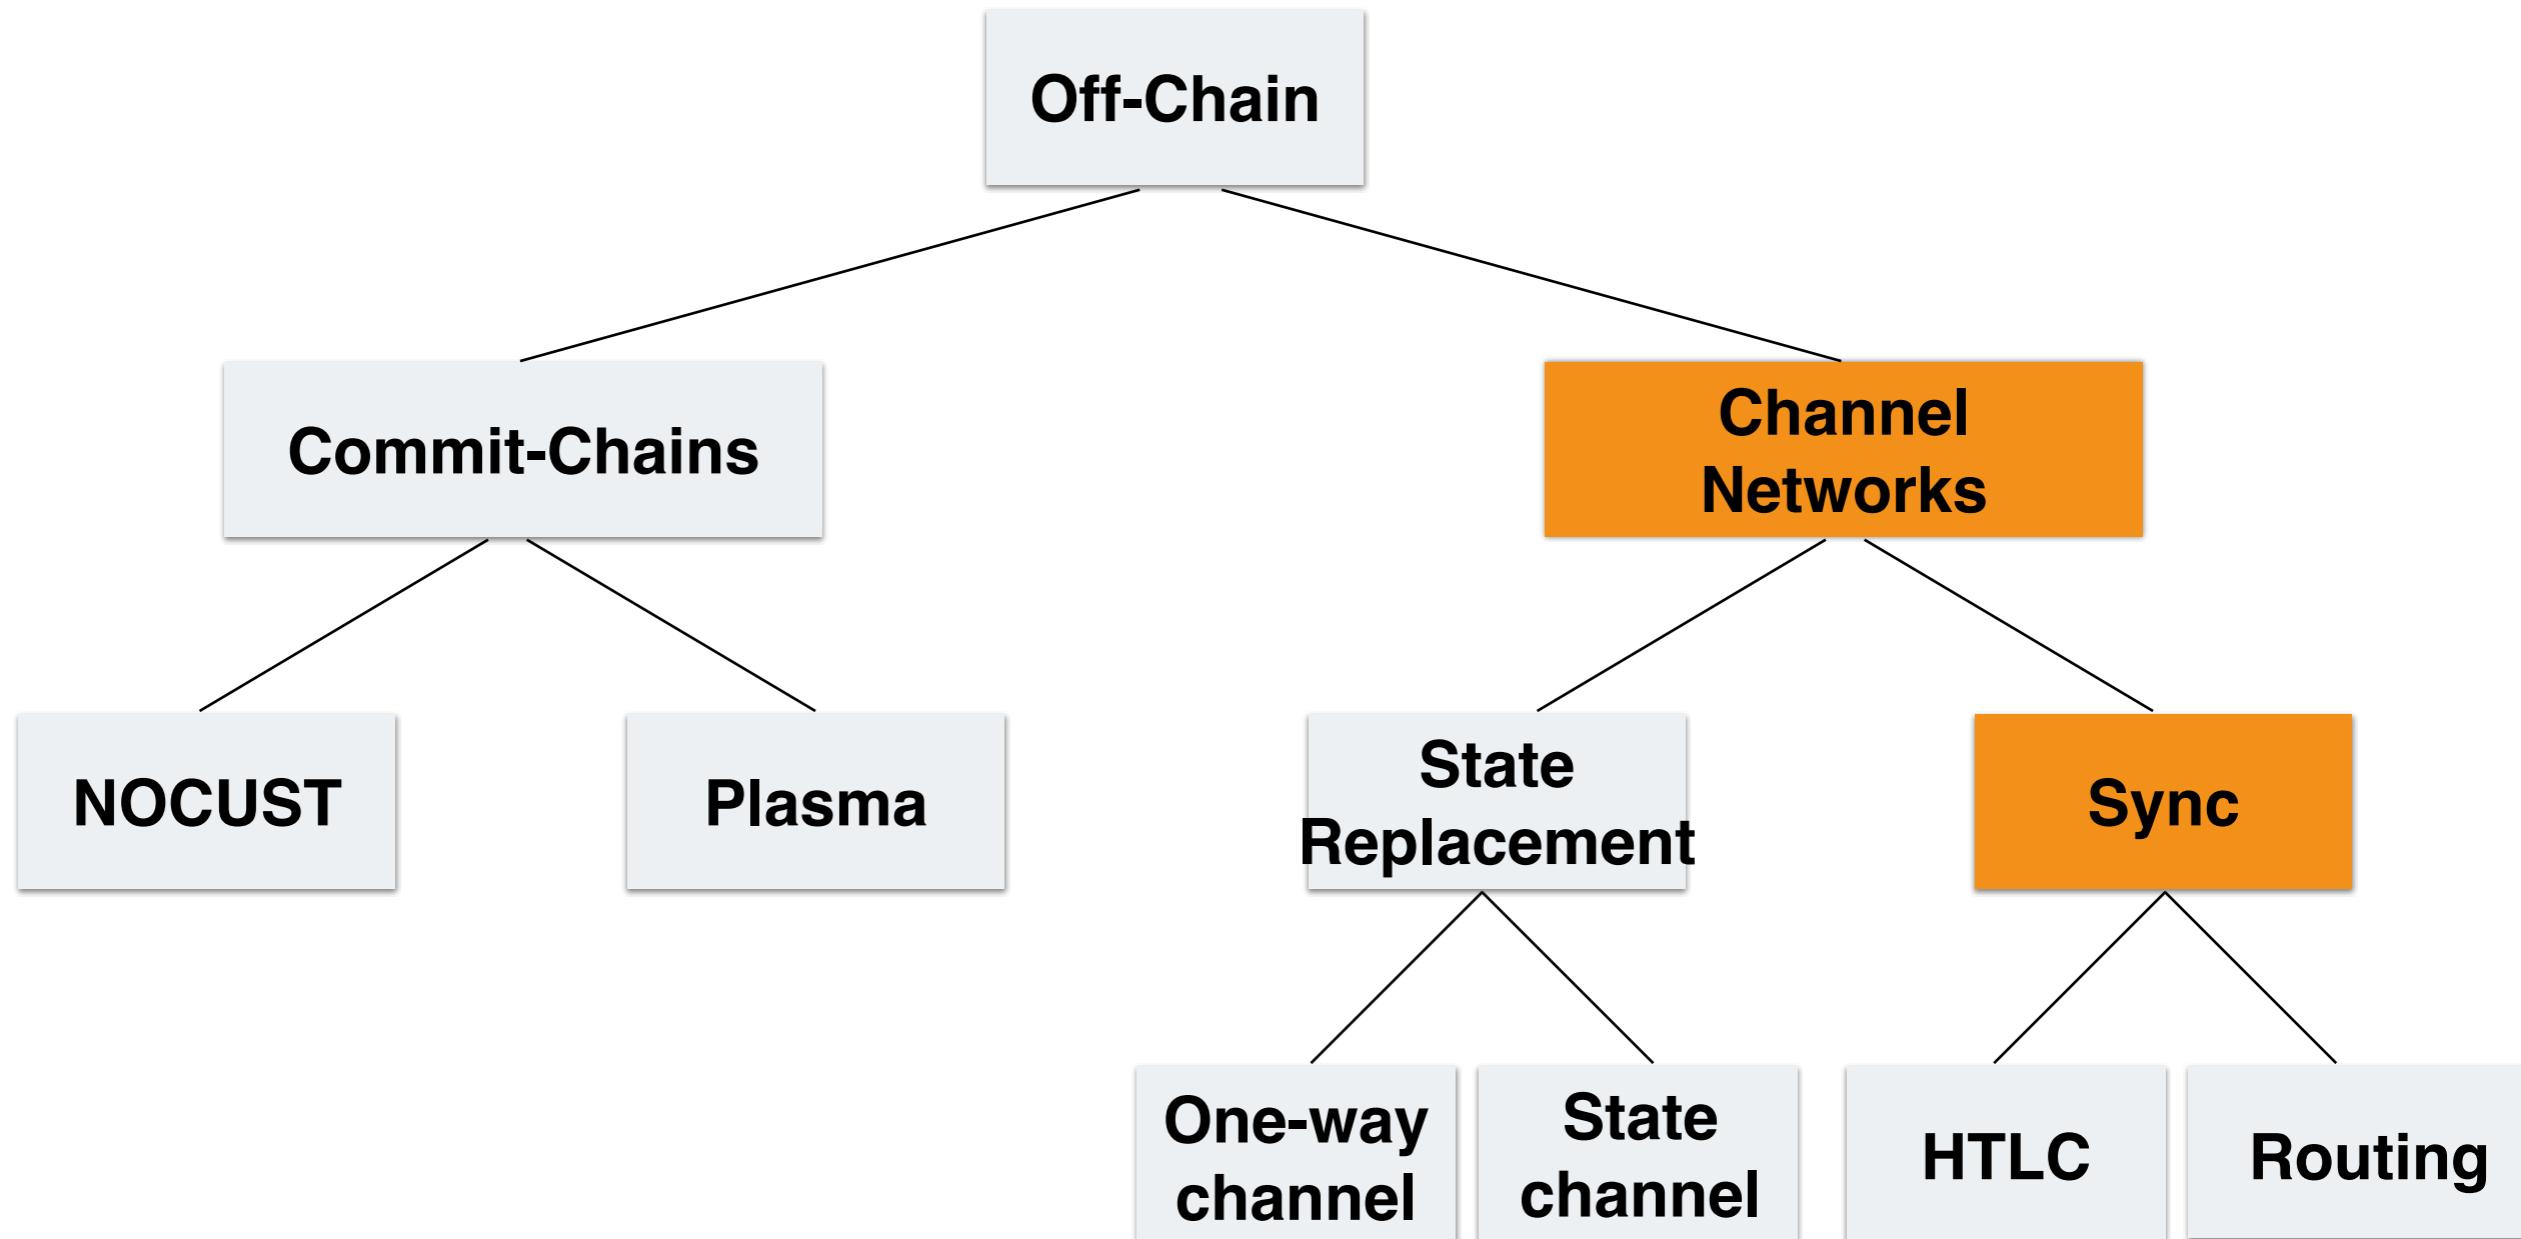

A close-up photograph of a white boat's hull and a metal chain anchor system against a dark blue sea. The boat's hull is white with some weathering and a small blue stripe. A heavy-duty metal chain is attached to the hull via a cleat and a shackle. The chain is partially submerged in the water. The background is a deep, dark blue sea.

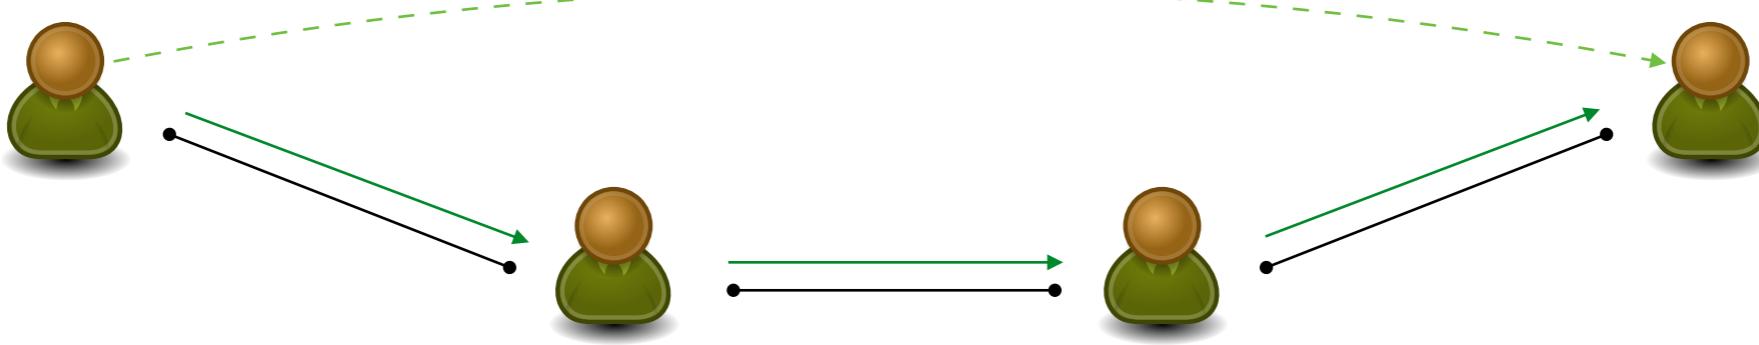

# Channel Networks

## HTLC

# Which Off-Chain Solution?

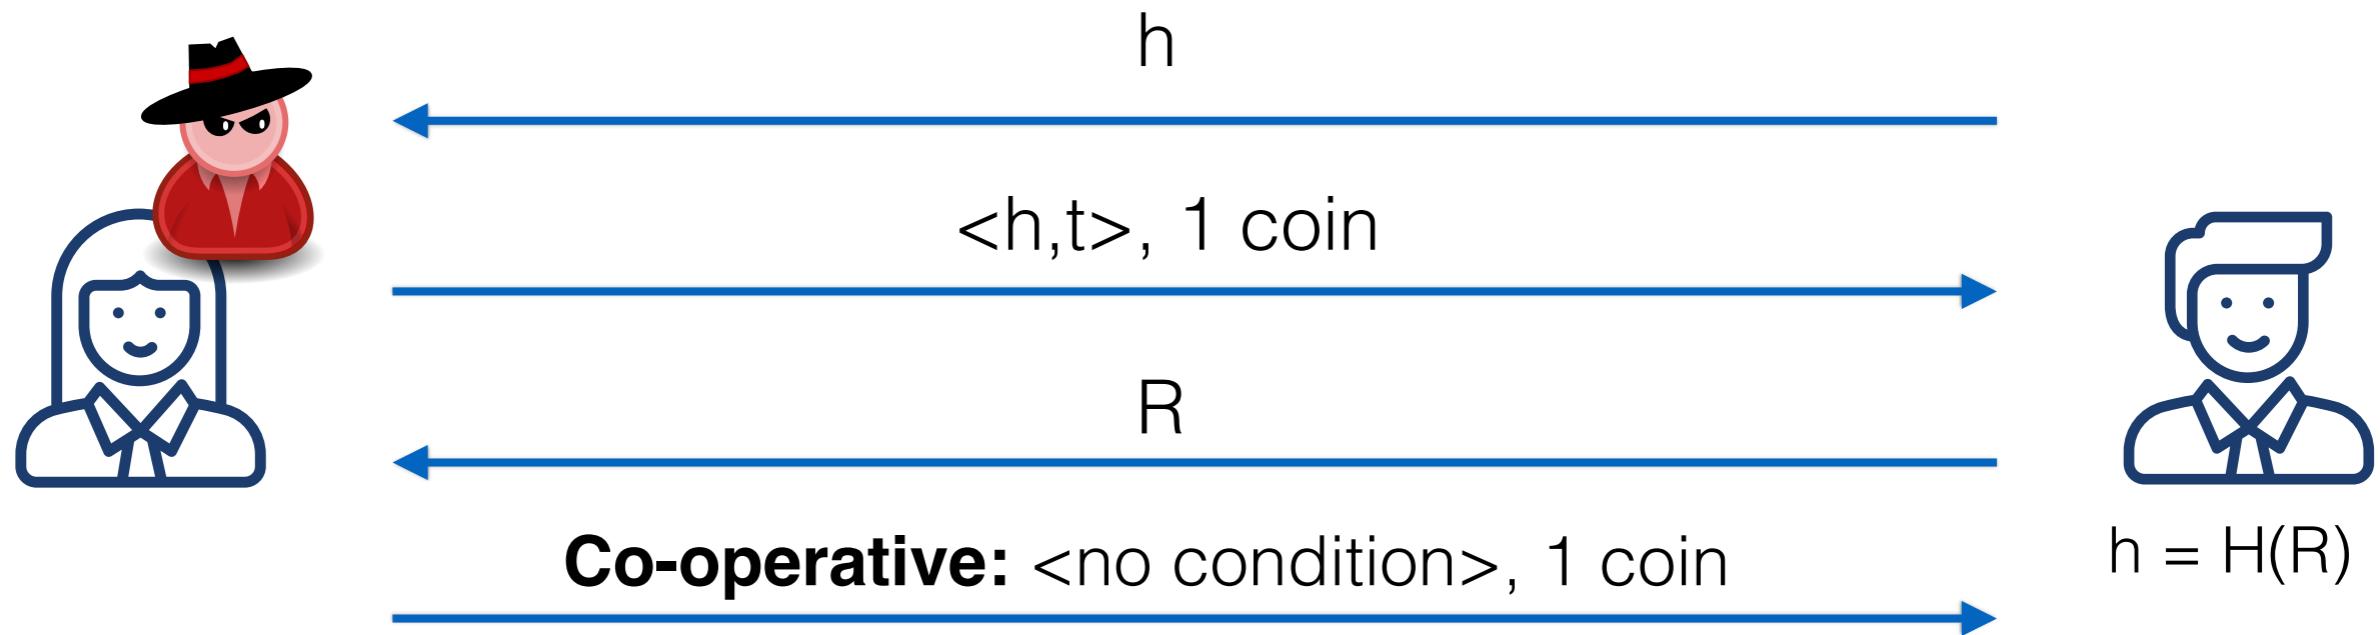

# Payment Channel Network

We need a **simple conditional transfer**.

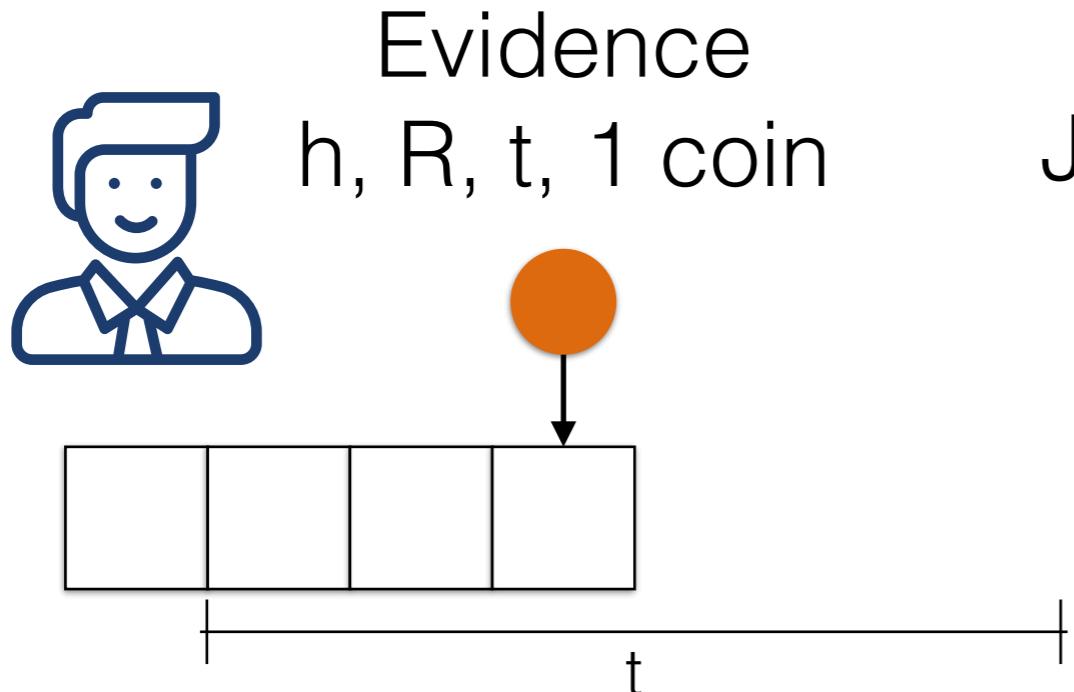

# A Humble Conditional Transfer

- (1) Jackson computes  $H(R)$  and shares  $h$
  - (2) Michaela's conditional transfer: "*Jackson, if you reveal  $R$  before time  $t$ , you get the coins*"
  - (3) Jackson reveals  $R$
  - (4) Michaela cooperates
- ..what if Michaela doesn't cooperate?**

## Hashed Time-locked Contract

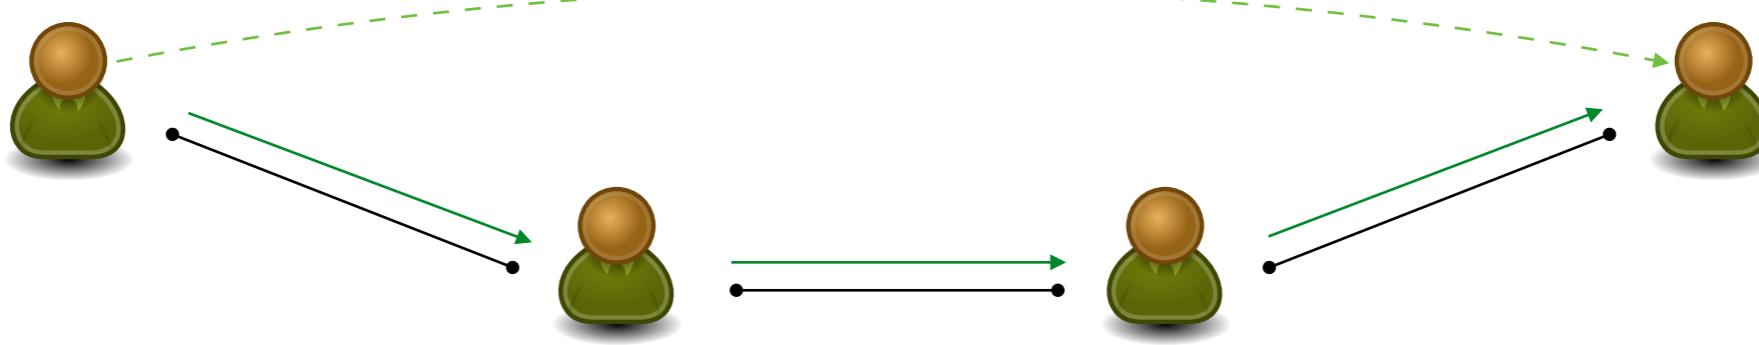

== conditional transfer + evidence

The blockchain confirms that Jackson revealed R before time t and complied with the contract

-> He receives the coin.

# Payment Channel Networks

Path-based Payments  
(HTLC)

We can synchronise a payment  
among peers on the path!

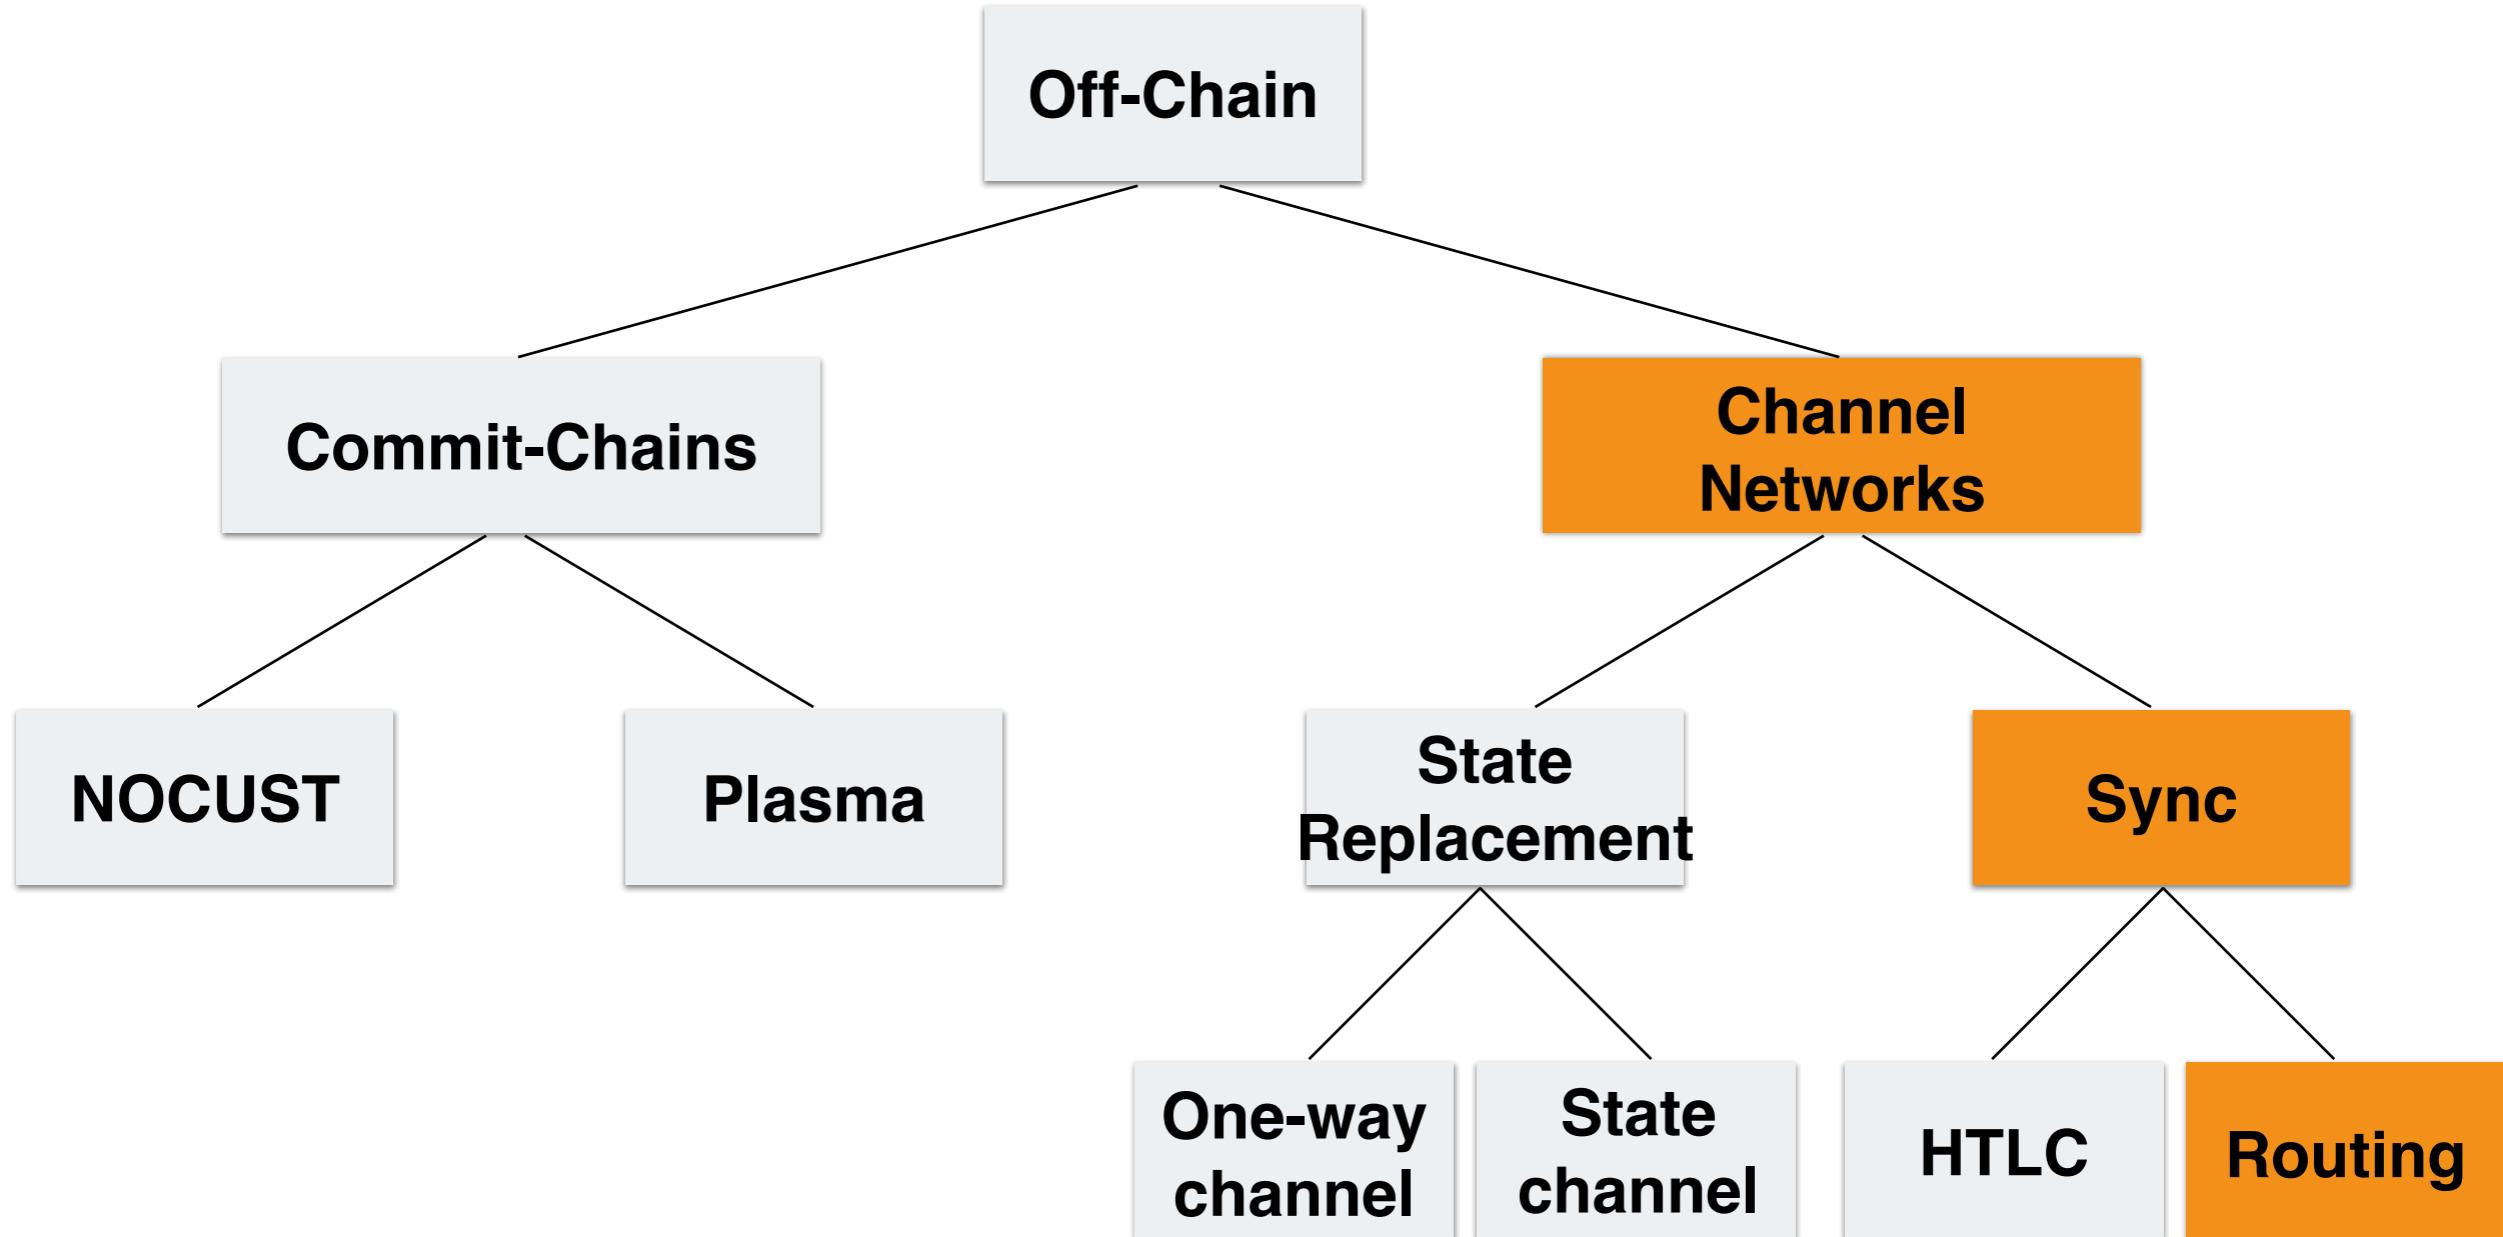

Path-based virtual  
Payment Channels  
(Perun)

We can set up a virtual channel  
to avoid intermediary peers to be responsive!

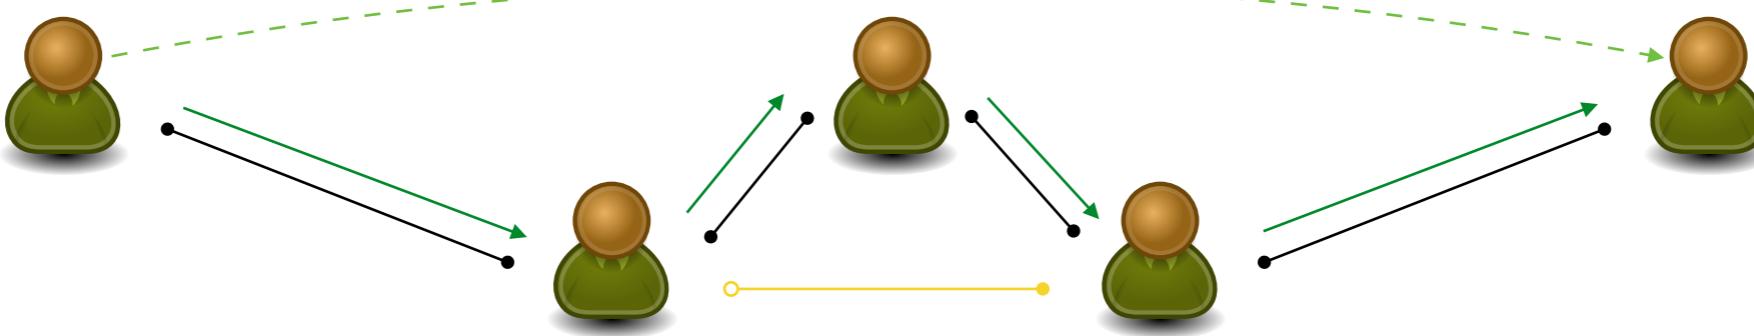

A close-up photograph of a white boat's bow and anchor chain against a dark blue sea. The boat's white hull is visible on the left, featuring a metal cleat and a anchor chain. A thick, weathered anchor chain runs across the frame. The water is a deep, dark blue.

# Channel Networks Routing

# Which Off-Chain Solution?

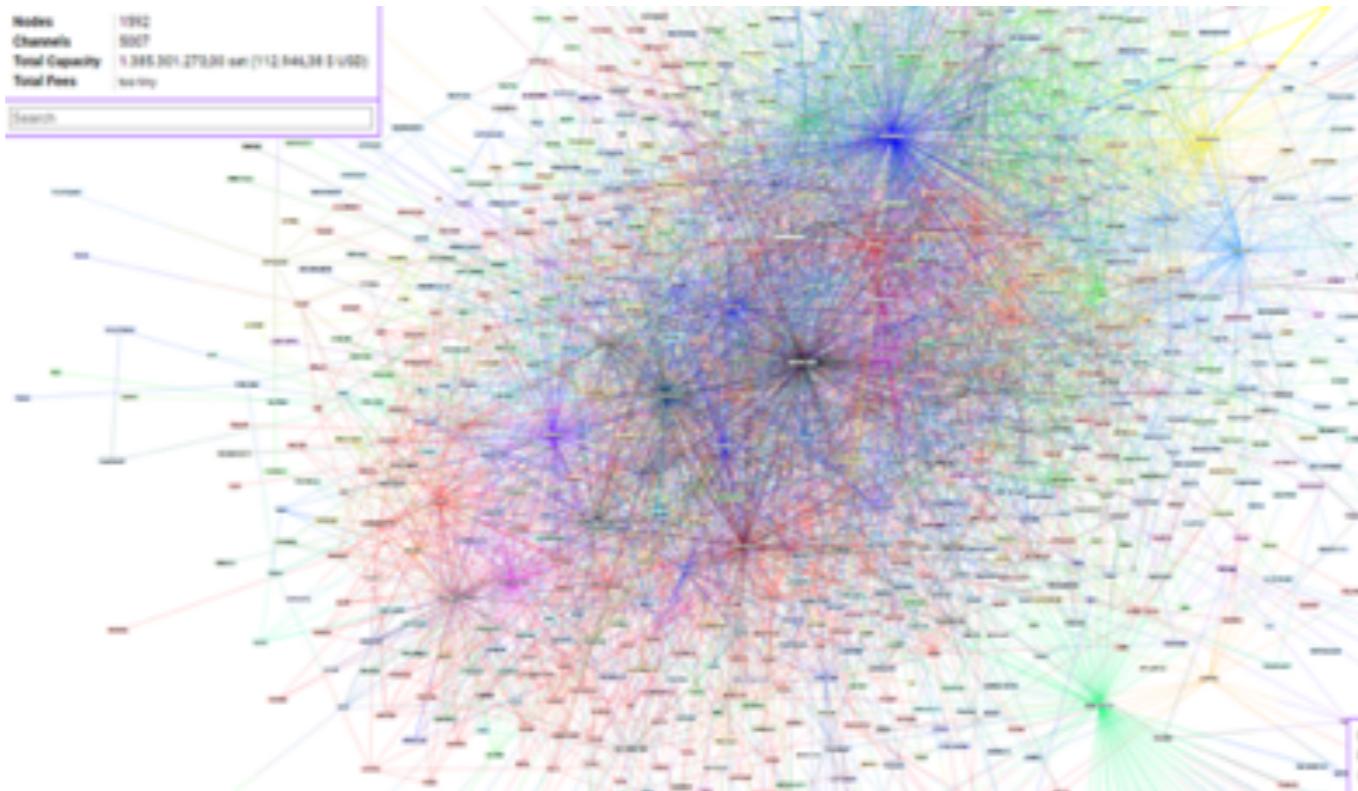

# Payment Channel Network - Routing

Route Finding

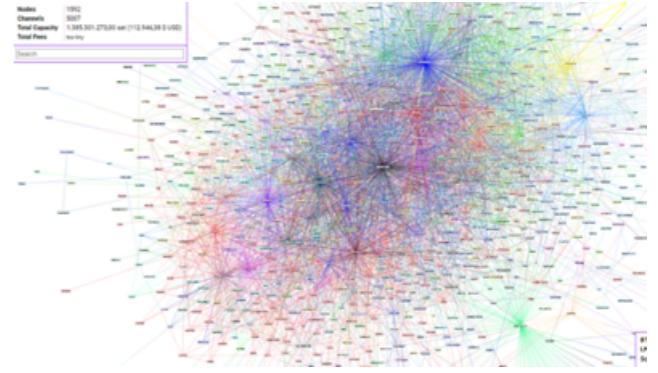

# Payment Channel Network - Routing

The blockchain keeps a **record** of which channels are open

Channels are **advertised** via a gossip protocol

# Routing Properties

- **Scalable:**

The routing algorithm should remain effective and efficient for large-scale PCN and high transaction rates.

- **Effectiveness:**

Given the network topology, the routing algorithm should find the path that will likely be successful.

- **Efficiency:**

The overhead of path discovery should be low in terms of communication, latency, and computation.

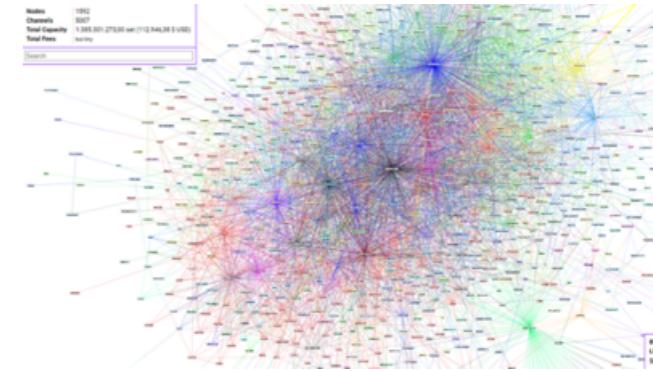

# Routing Approaches

Topology is known.

## Source-routing

Sender computes best path, during the transfer, each hop is told the identity of the next hop.

Topology is **not** known.

## Per-hop routing

Every hop is aware of the final destination and they chose the next hop.

Silent Whispers by *Roos et al.*

# Routing and Privacy

- **Value-Privacy:**  
Find paths without revealing the value of a transfer.
- **Transfer-Privacy:**  
Sender and receiver privacy should hold.

A close-up photograph of a white boat's bow and anchor chain against a dark blue sea. The boat's white hull is visible on the left, featuring a metal cleat and a anchor chain locker. A thick, rusty anchor chain runs across the frame. The dark blue sea fills the background.

# Channel Networks Summary

**Theory (Avarikioti et al.) and  
practice (Lightning) suggest star-topologies.**

# The good, bad and ugly of Payment Channels

**Collateral for each hop**

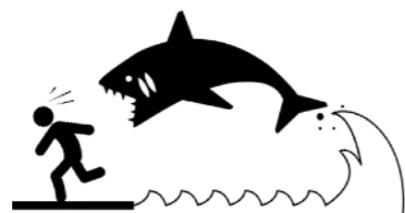

**No direct connection needed**

**Decentralized, limited censorship**

**On-chain channel establishment**

**Wormhole attacks**

**Optimistically fast and cheap**

**Channel Networks  
Trusted Execution  
Environments**

# PCN based on Trusted Execution Environments

- **TEEs:**  
Efficient and fast payments among peers
- **Privacy:**  
Intermediary nodes are not visible outside the enclave
- **Offline Payments:**  
Peers can remain offline!
- **Examples:**  
Teechan, Teechain

A close-up photograph of a white boat's hull and a metal chain anchor system against a dark blue sea. The boat's hull is white with some weathering and a small blue stripe. A heavy-duty metal chain is attached to a metal plate on the hull. A white plastic anchor rode is coiled around the chain. The background is the dark blue ocean.

# Payment Channel Hubs

# Payment Channel Hub

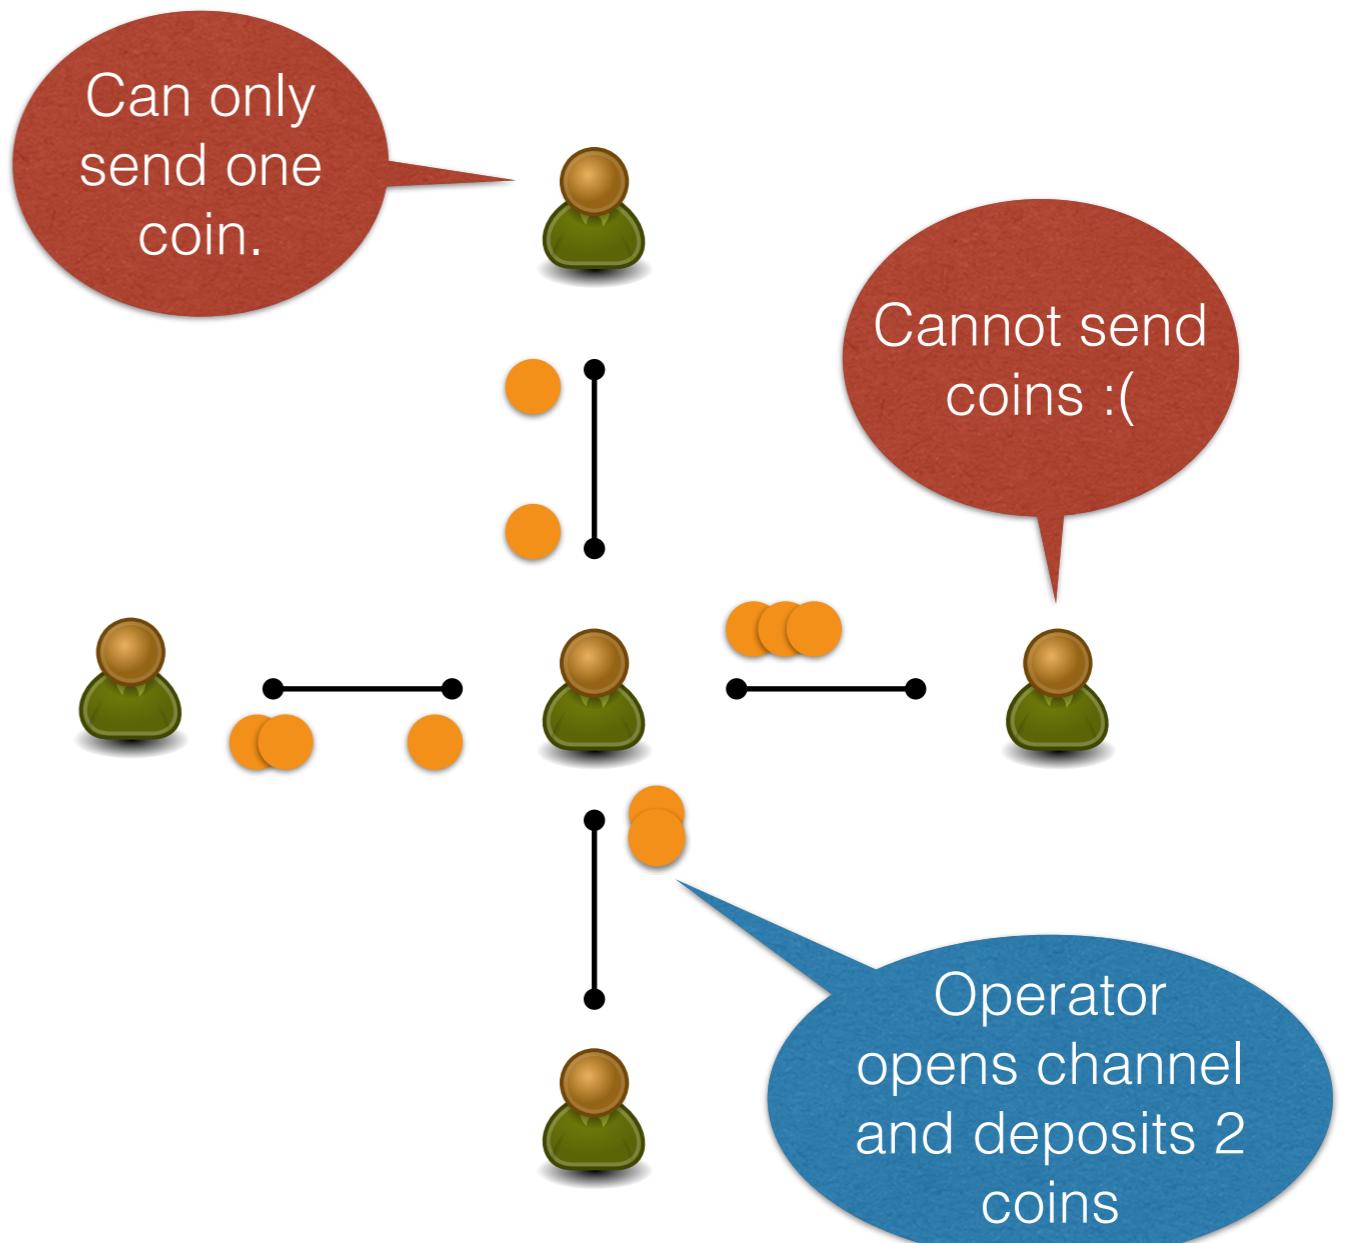

**Big pot of money**

Expensive/slow on-chain  
transaction

Payment Channel Hubs are great  
for instant finality and no trust.

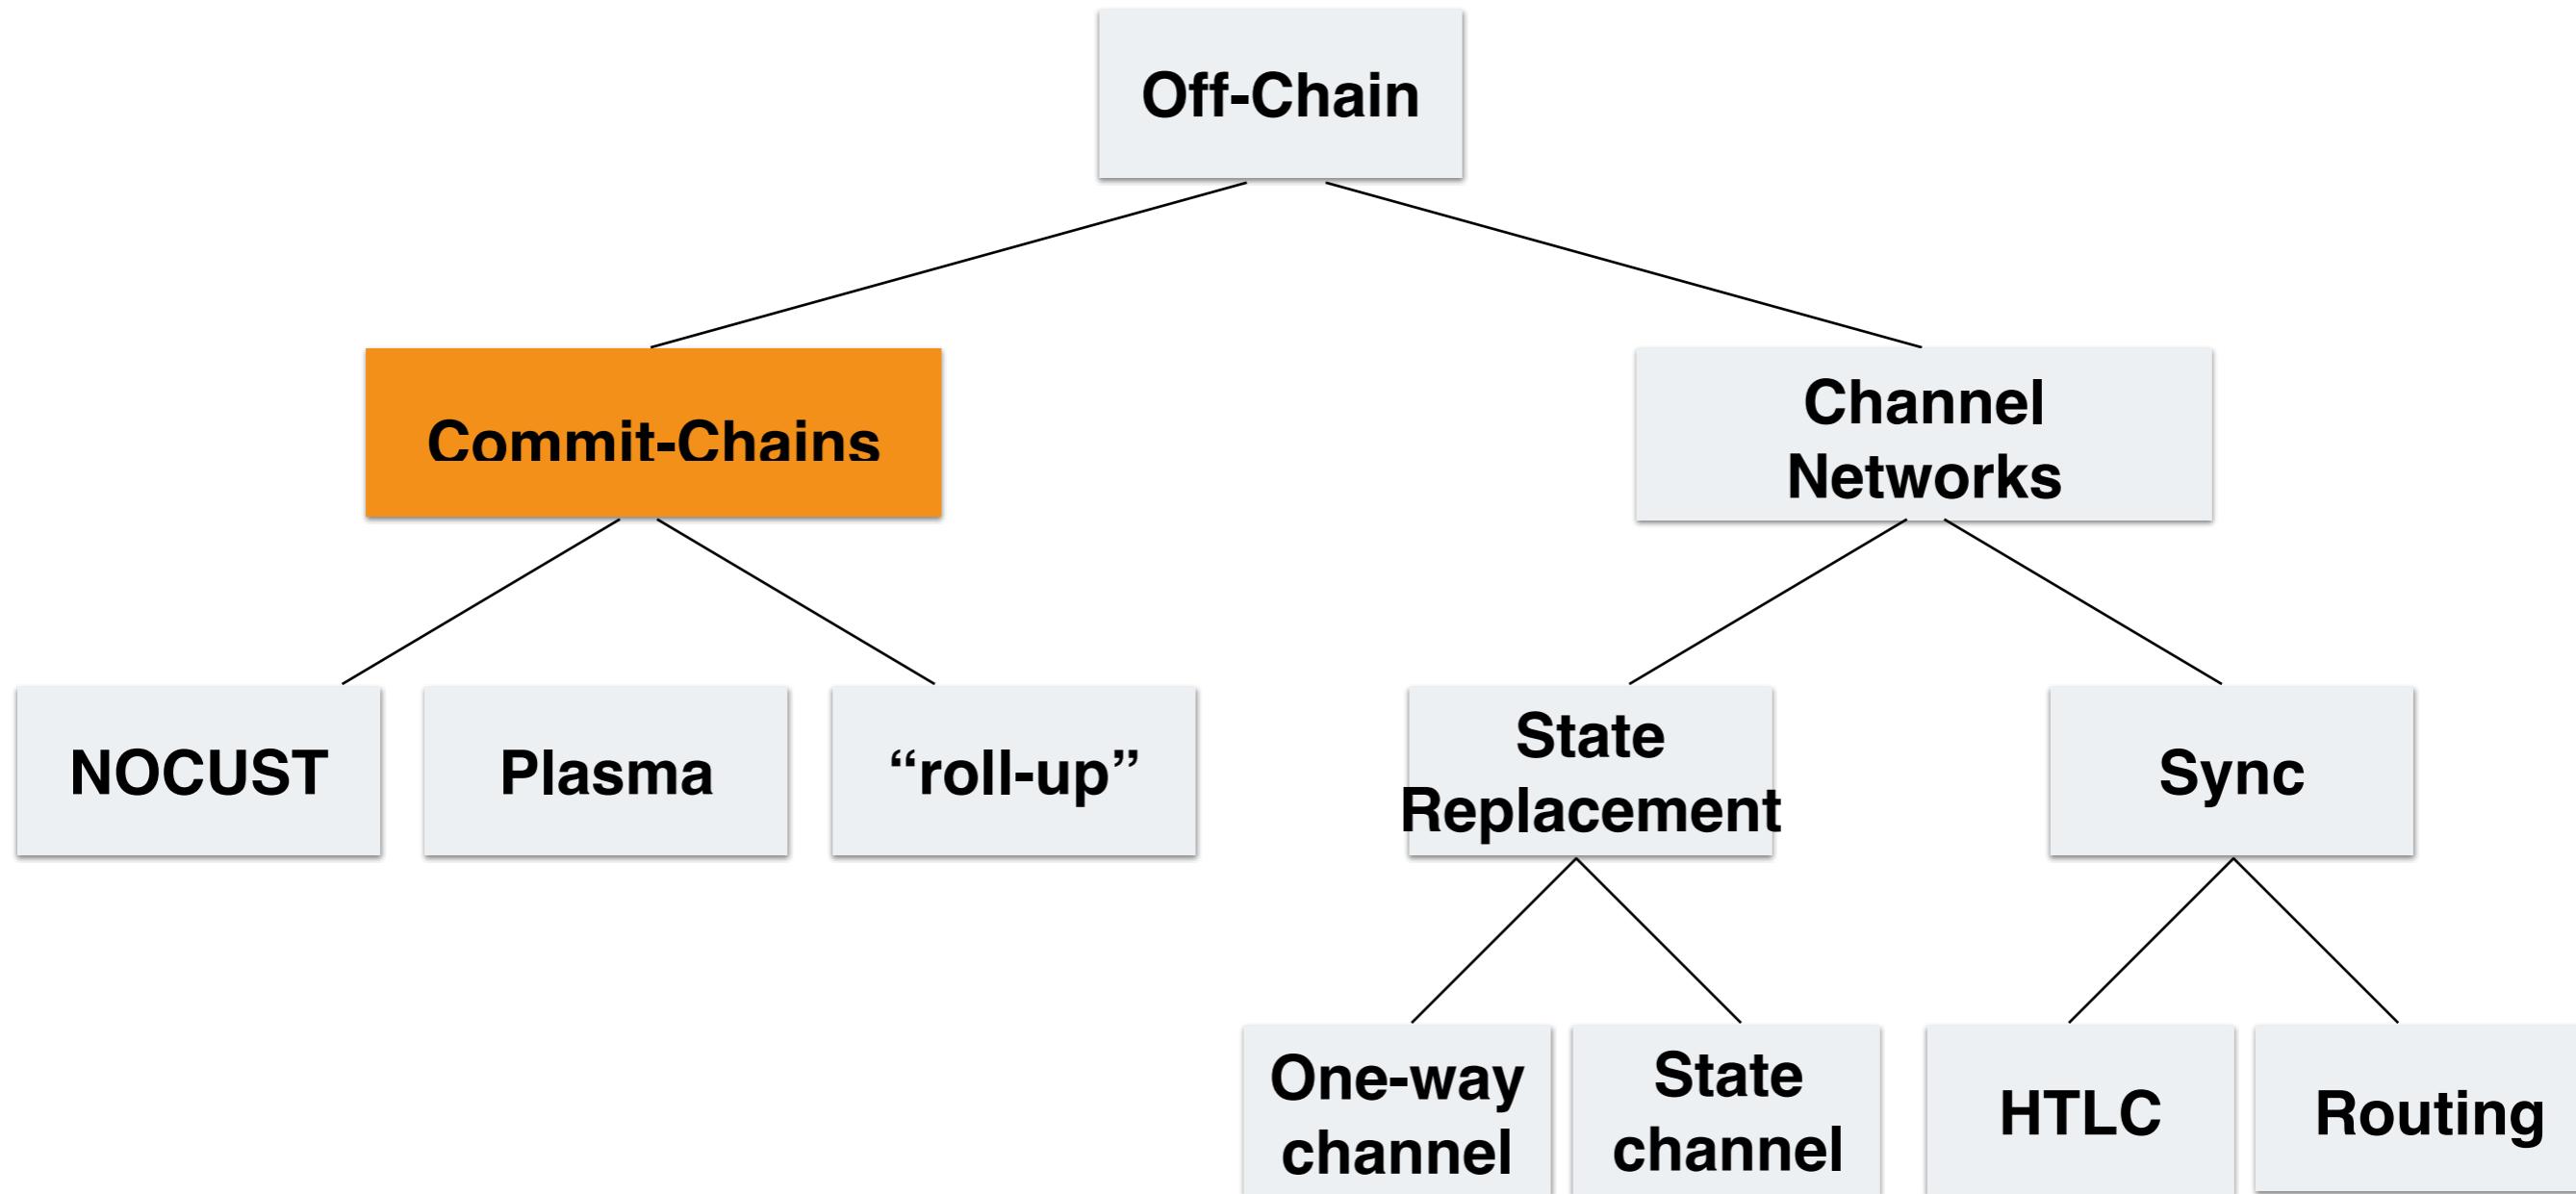

But expensive to run..

**Can we do better with eventual finality?**

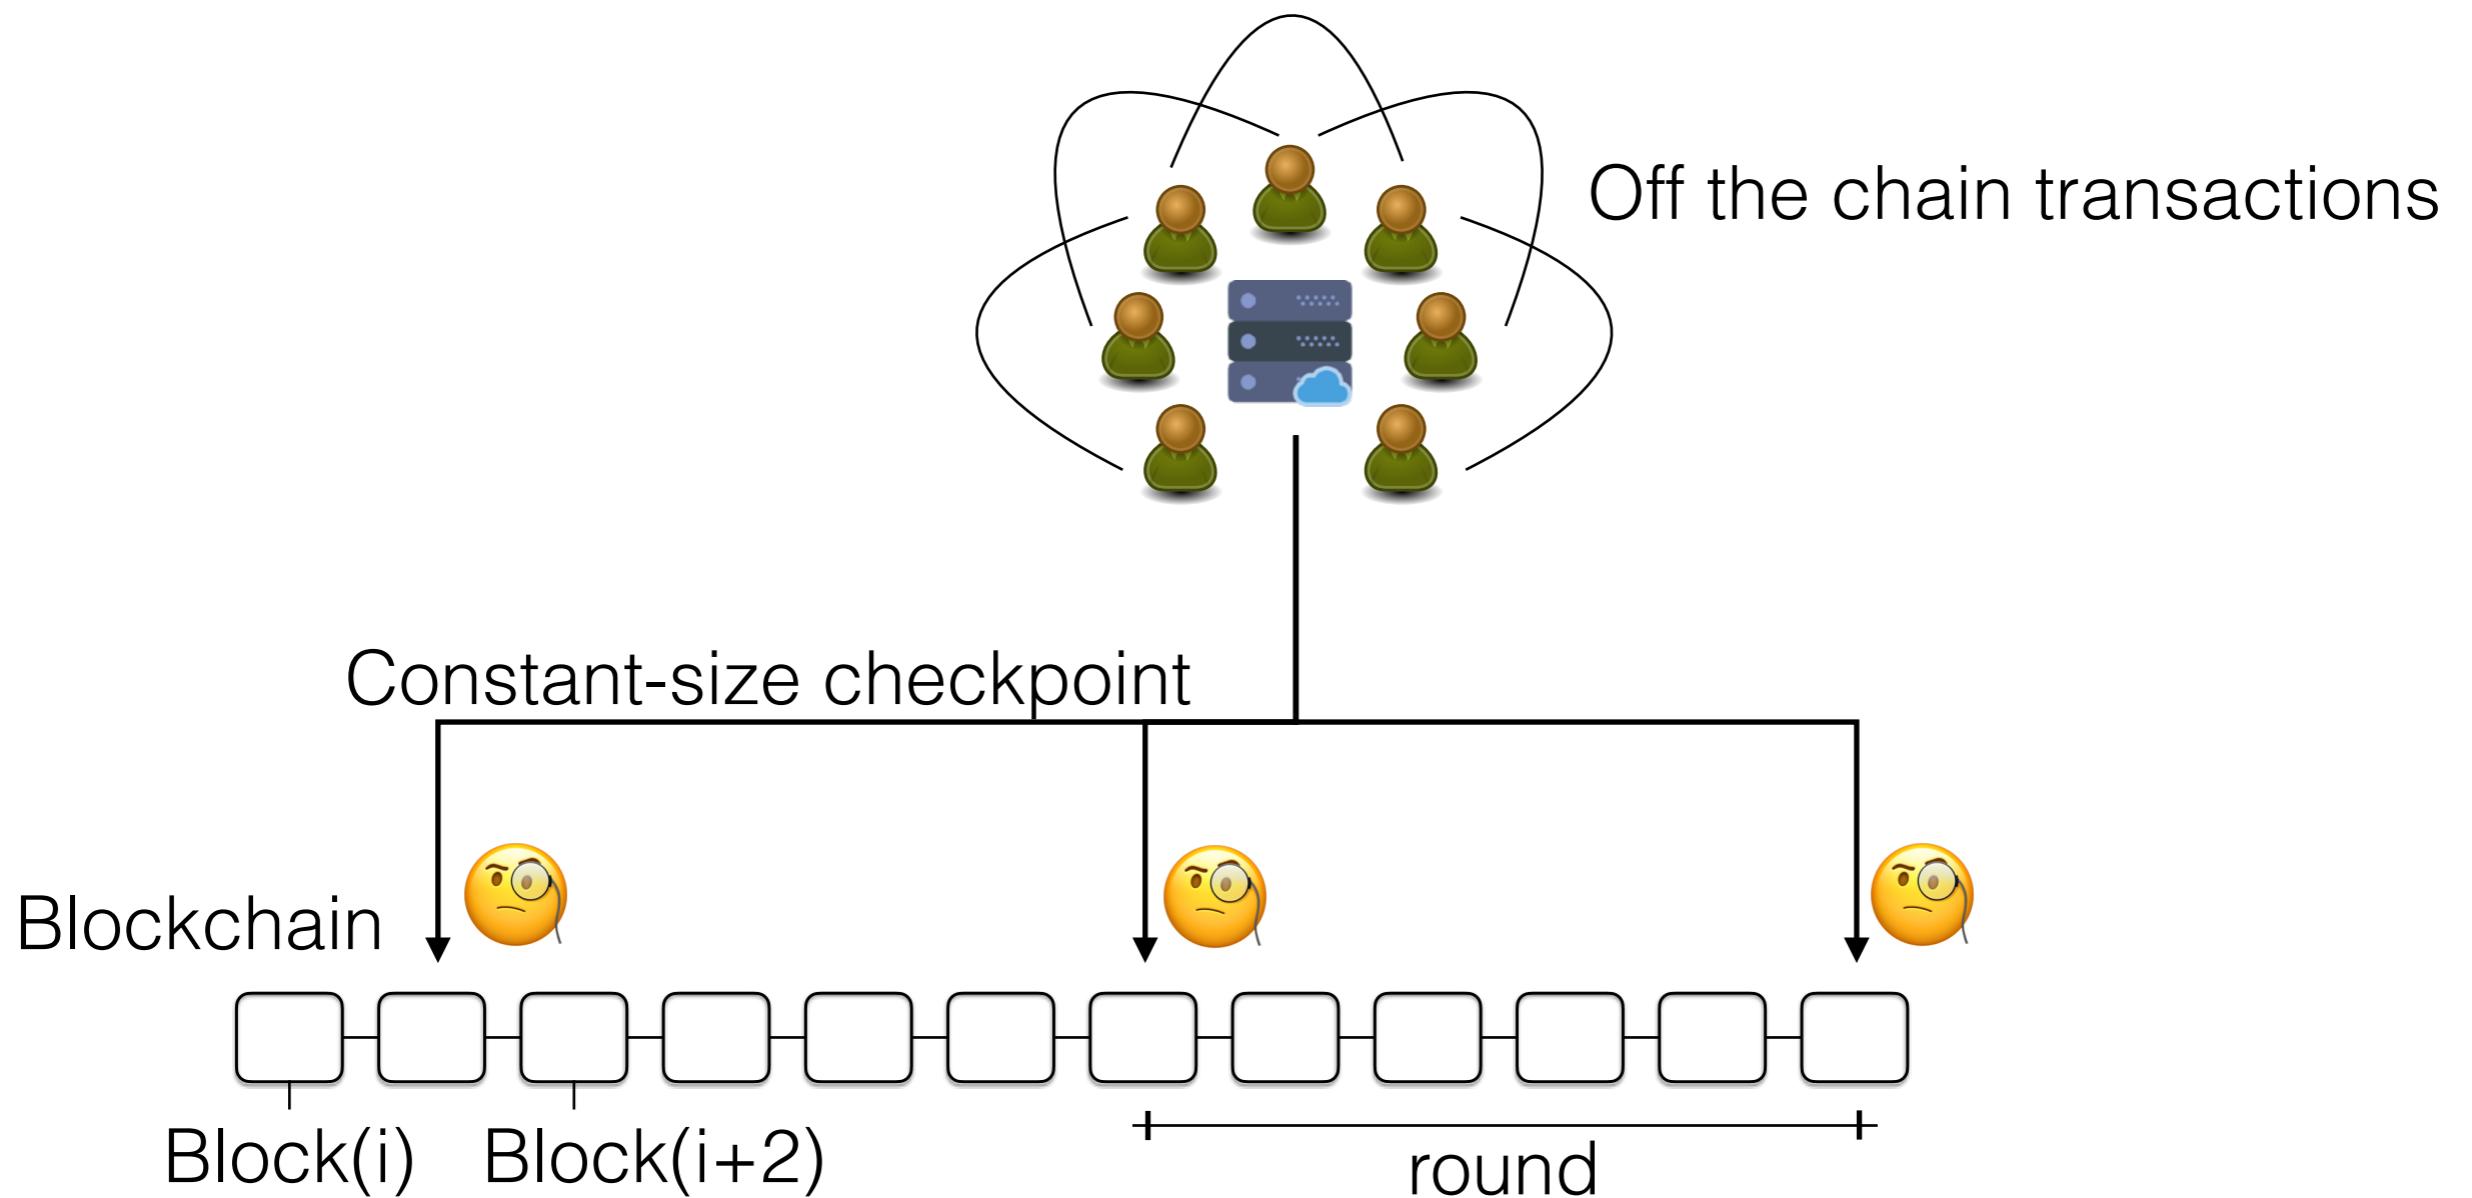

A close-up photograph of a white boat's hull and a metal anchor chain against a dark blue sea. The chain is attached to a metal plate on the hull. The water is dark blue with some ripples.

**Commit-Chains**

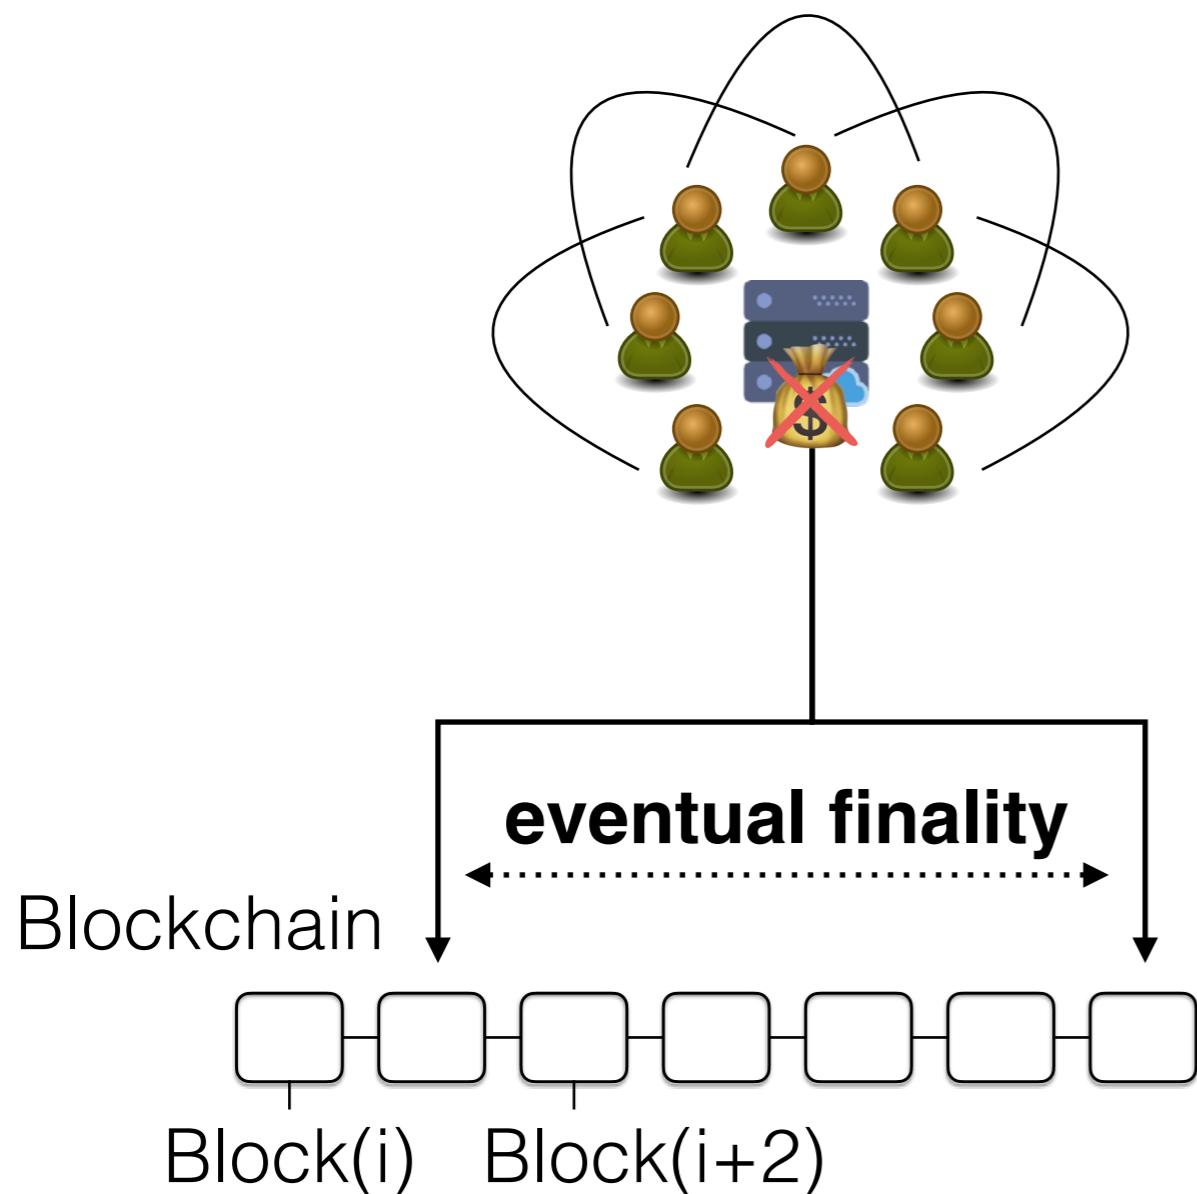

# Which off-chain solution?

# Commit-Chains

## Without Collateral → Eventual Finality

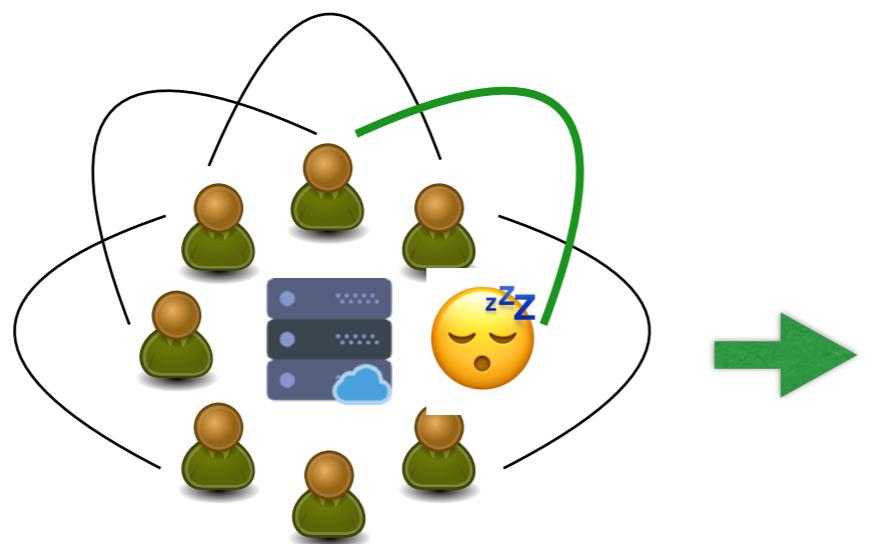

No collateral by operator

Recipient should wait..

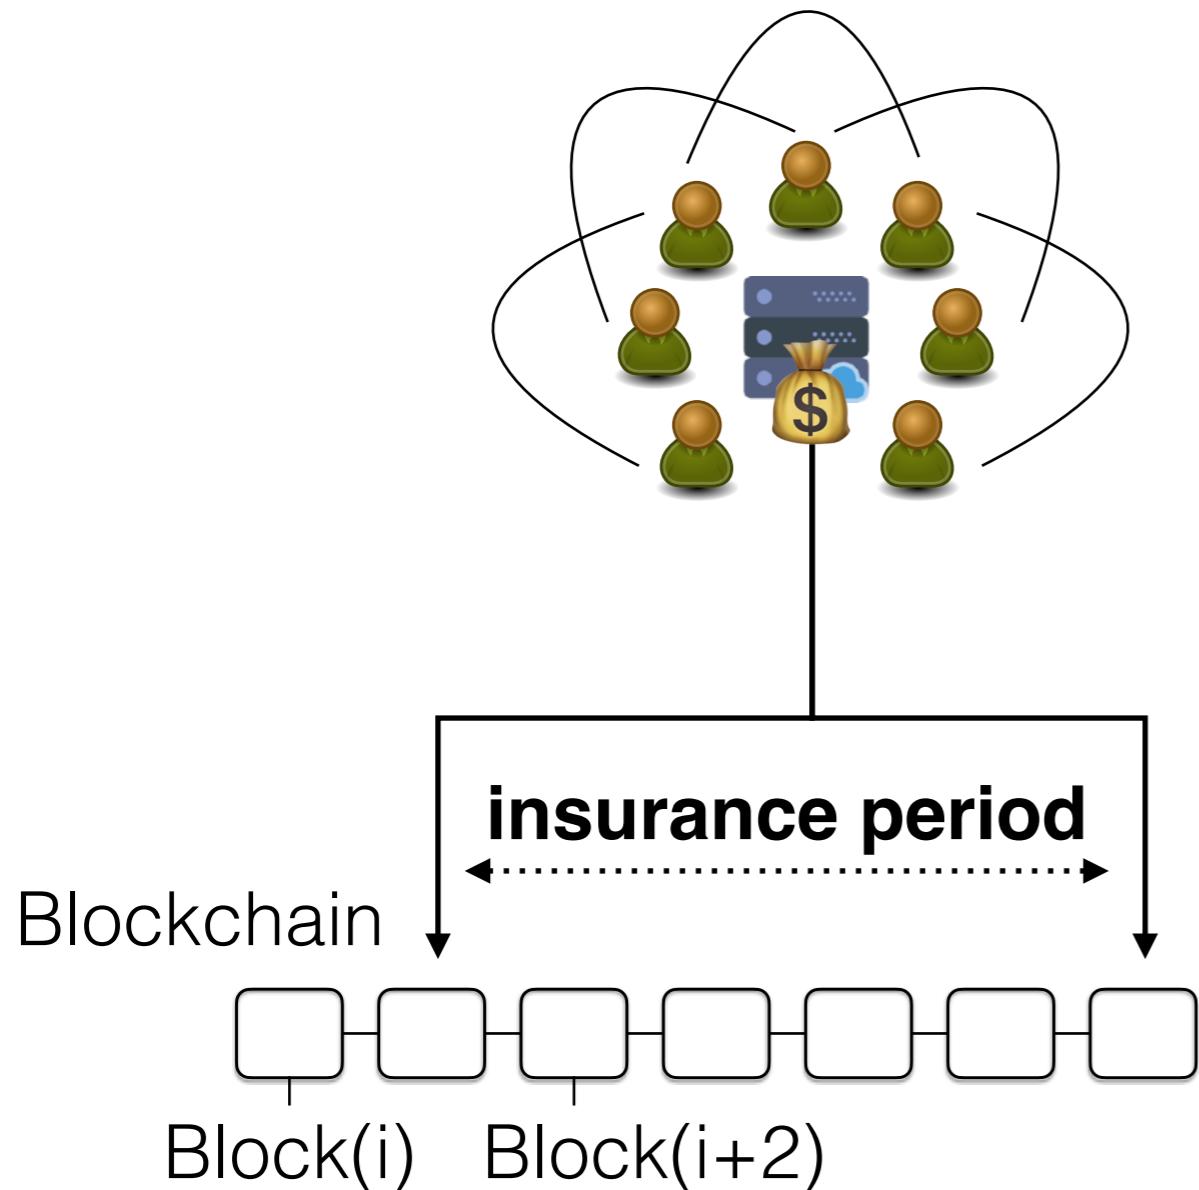

## Receive TX while offline

Off the chain transactions

Like on-chain transactions..

## With collateral → Instant finality

- 💰 Insurance pool
- 🔄 Collateral re-usable each round
- ⭐ TX can be accepted instantly
- 🥳 Collateral allocation O(1) for all users

# Join without on-chain Transaction

- ◆ Instant
- ◆ CO<sub>2</sub> friendly (Zero gas costs)

# Wait.. a centralized Operator

..but untrusted and non-custodial!

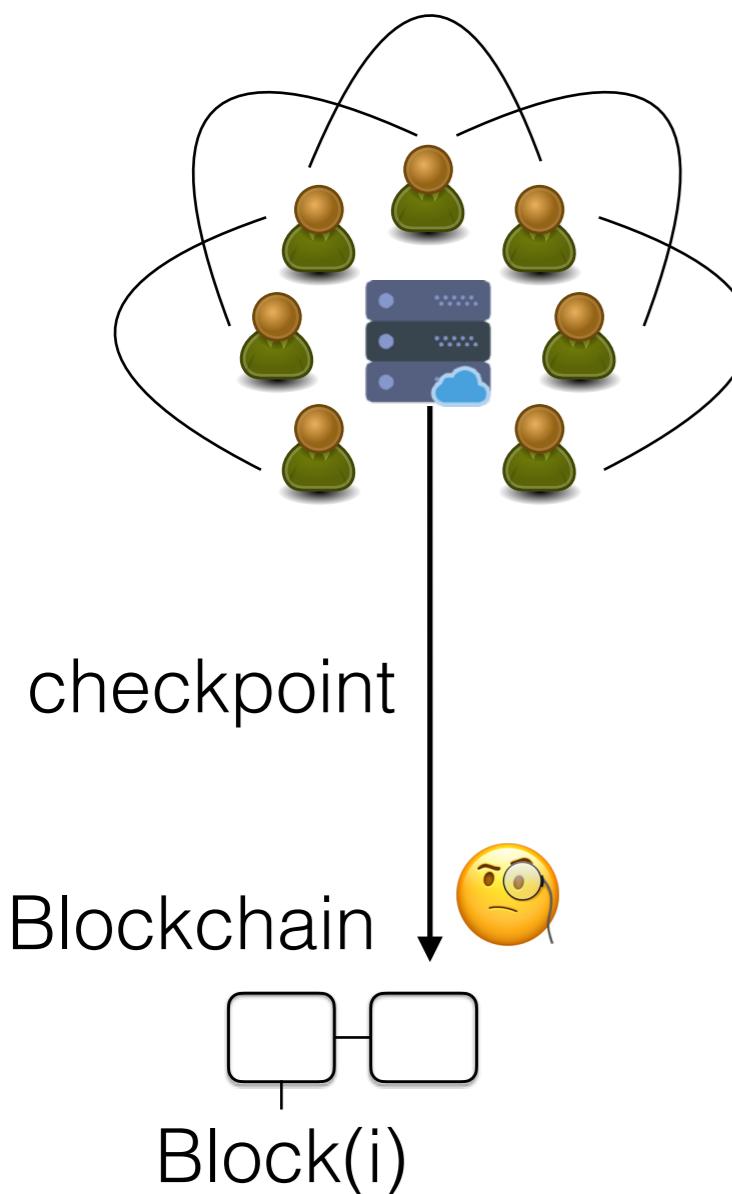

## Cannot

- ◆ steal coins
  - ◆ double spend coins
  - ◆ mint new coins
- (if users follow the protocol..)

A close-up photograph of a white boat's hull and a metal chain anchor system against a dark blue sea. The chain is rusted and attached to a metal plate on the hull. A white plastic fairlead is visible, and a rope extends from it towards the right.

# Commit-Chains Plasma Cash

# Plasma (Cash)

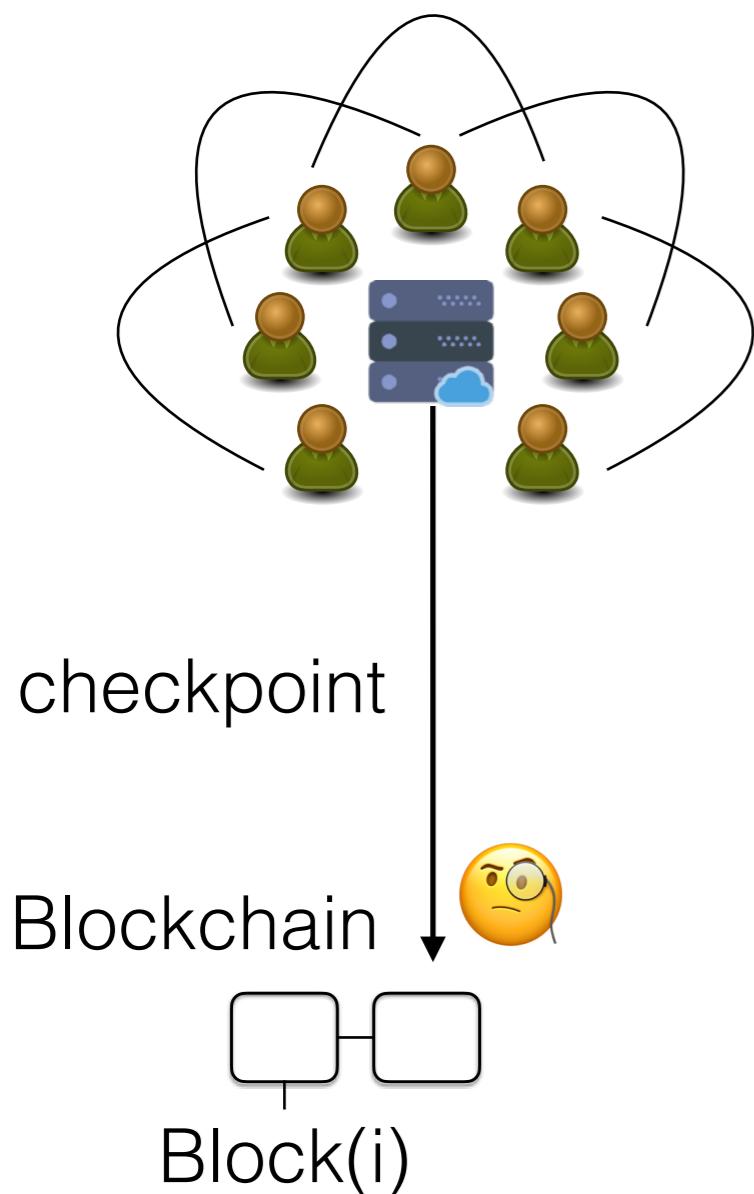

- **Non-Fungible Coins:**  
Deposit a coin -> Serial Number Coin
- **Merkle Tree:**  
Every leaf is a coin.

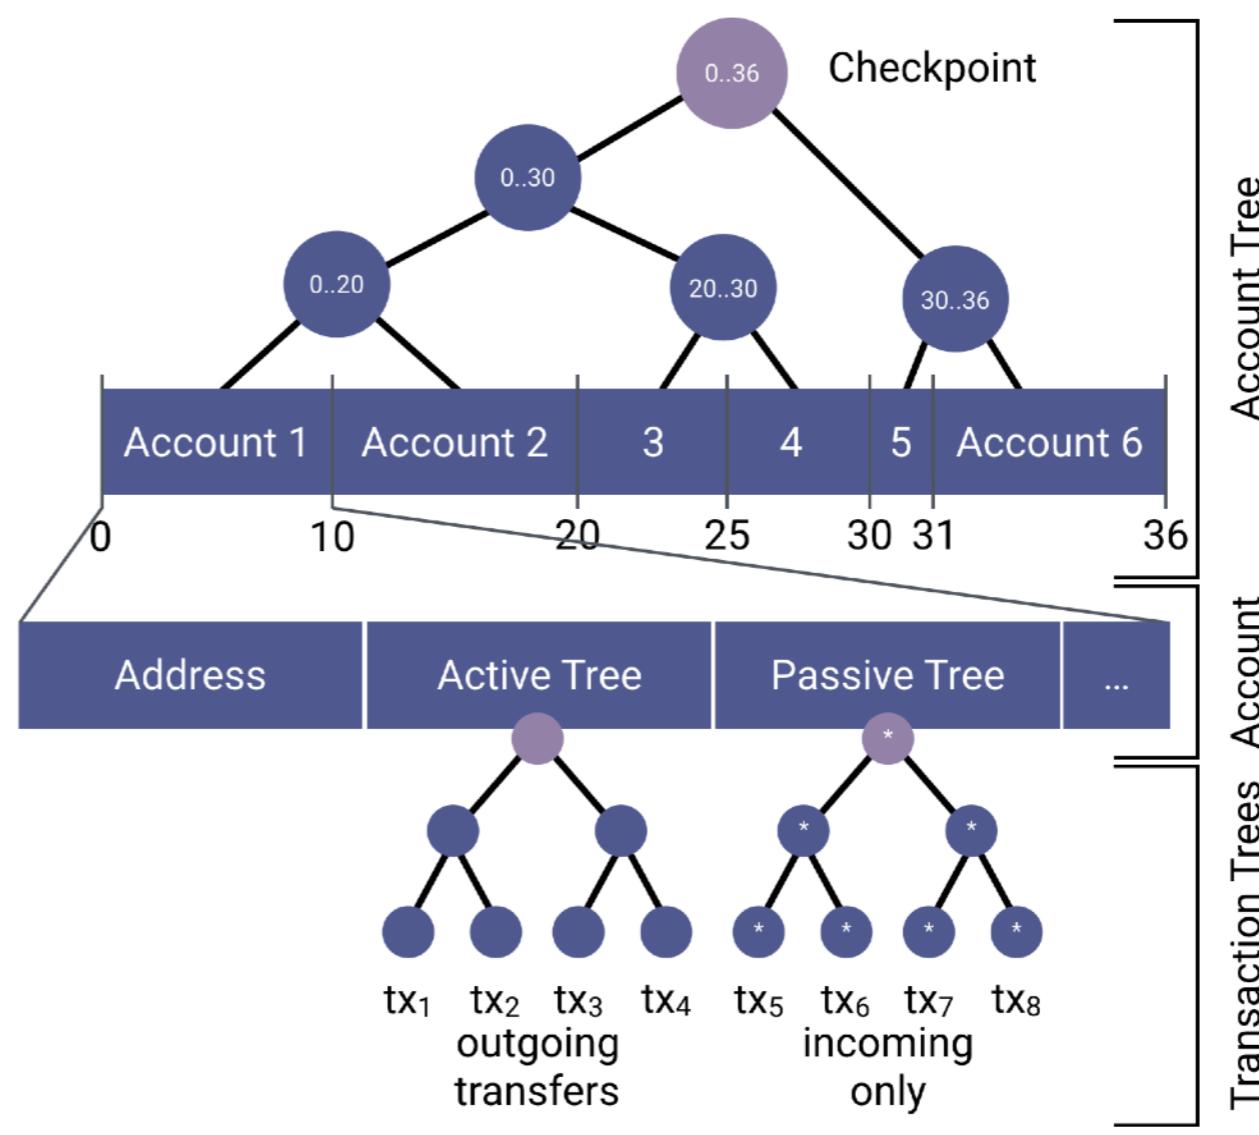

A close-up photograph of a white boat's bow and anchor chain against a dark blue sea. The boat's white hull is visible on the left, featuring a metal cleat and a anchor chain locker. A thick, rusty anchor chain runs across the frame. The water is a deep, dark blue.

**Commit-Chains**  
**NOCUST**

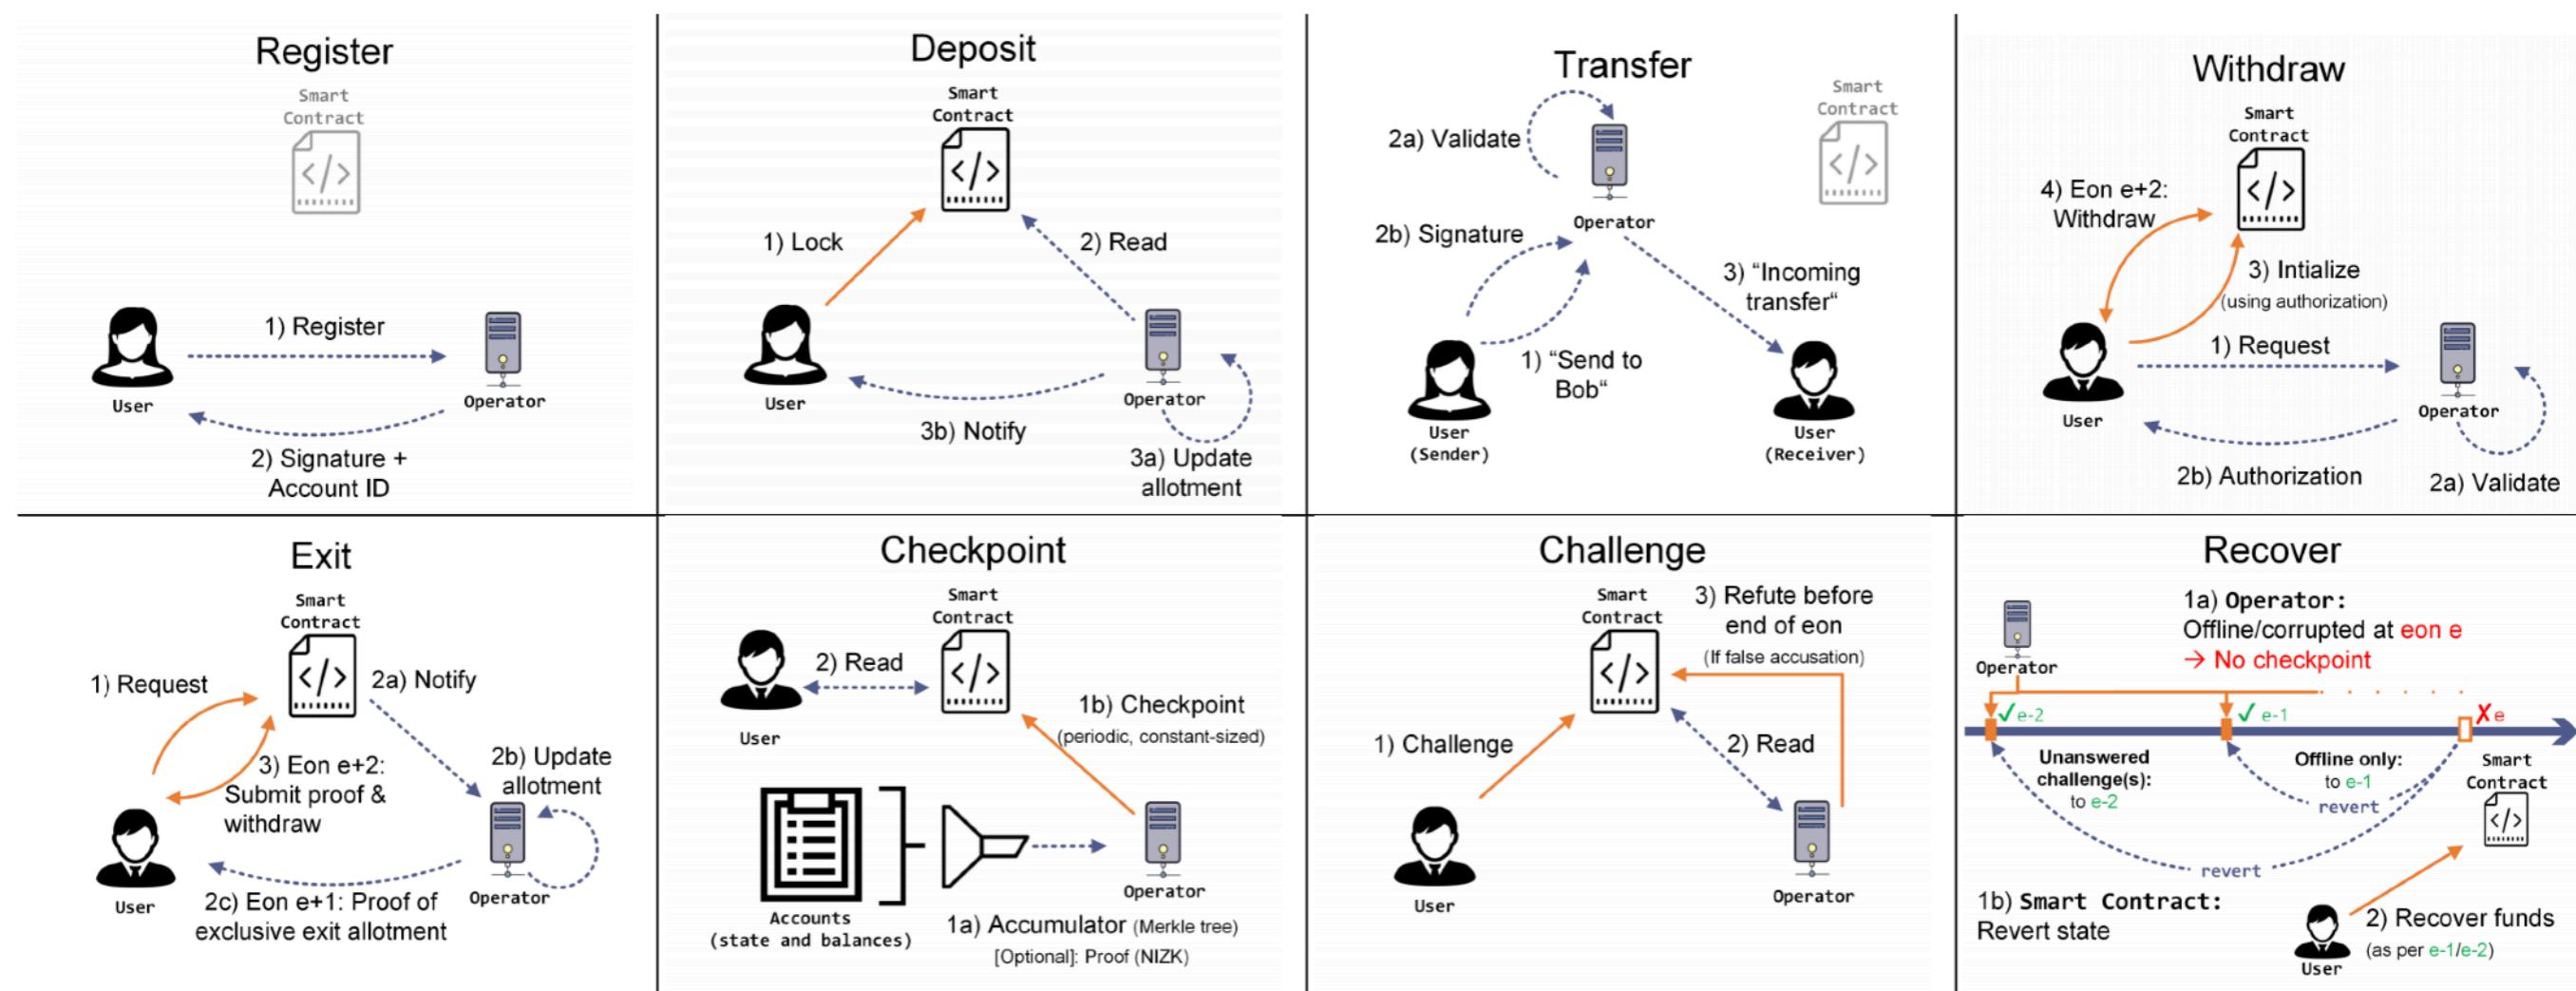

# NOCUST

**Fungible Coins:**  
Deposit a coin ->  
Balance credit in a Merkle Tree

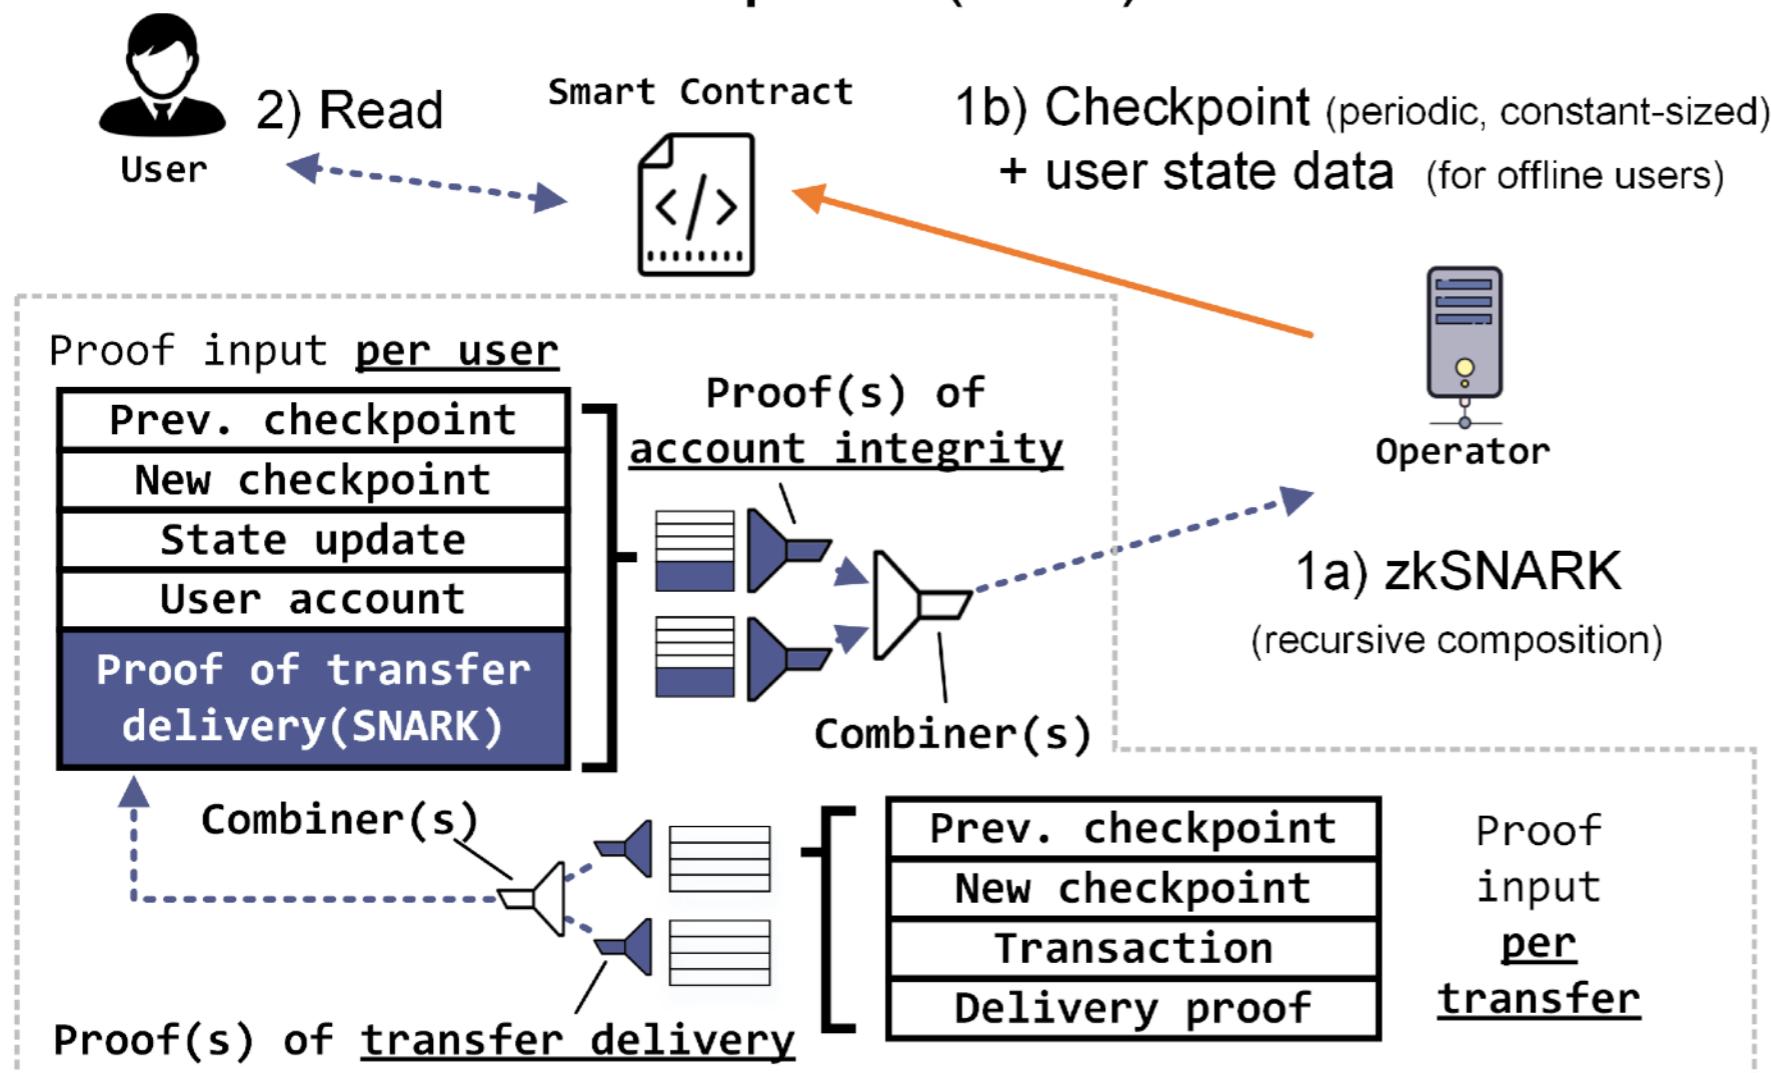

# NOCUST

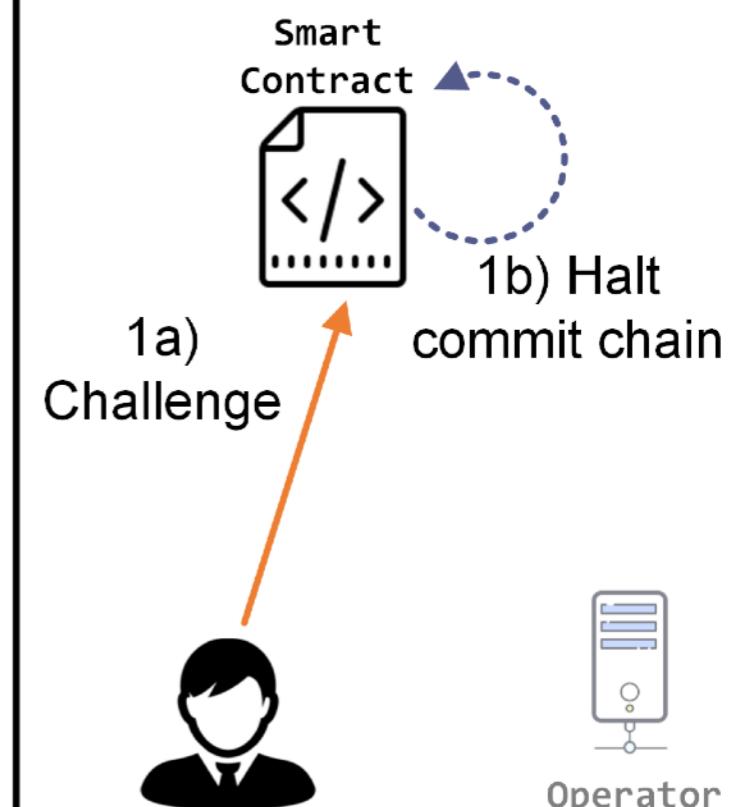

<https://eprint.iacr.org/2018/642.pdf>

# NOCUST ZKP - Adding Succinct Proofs

## Checkpoint (ZKP)

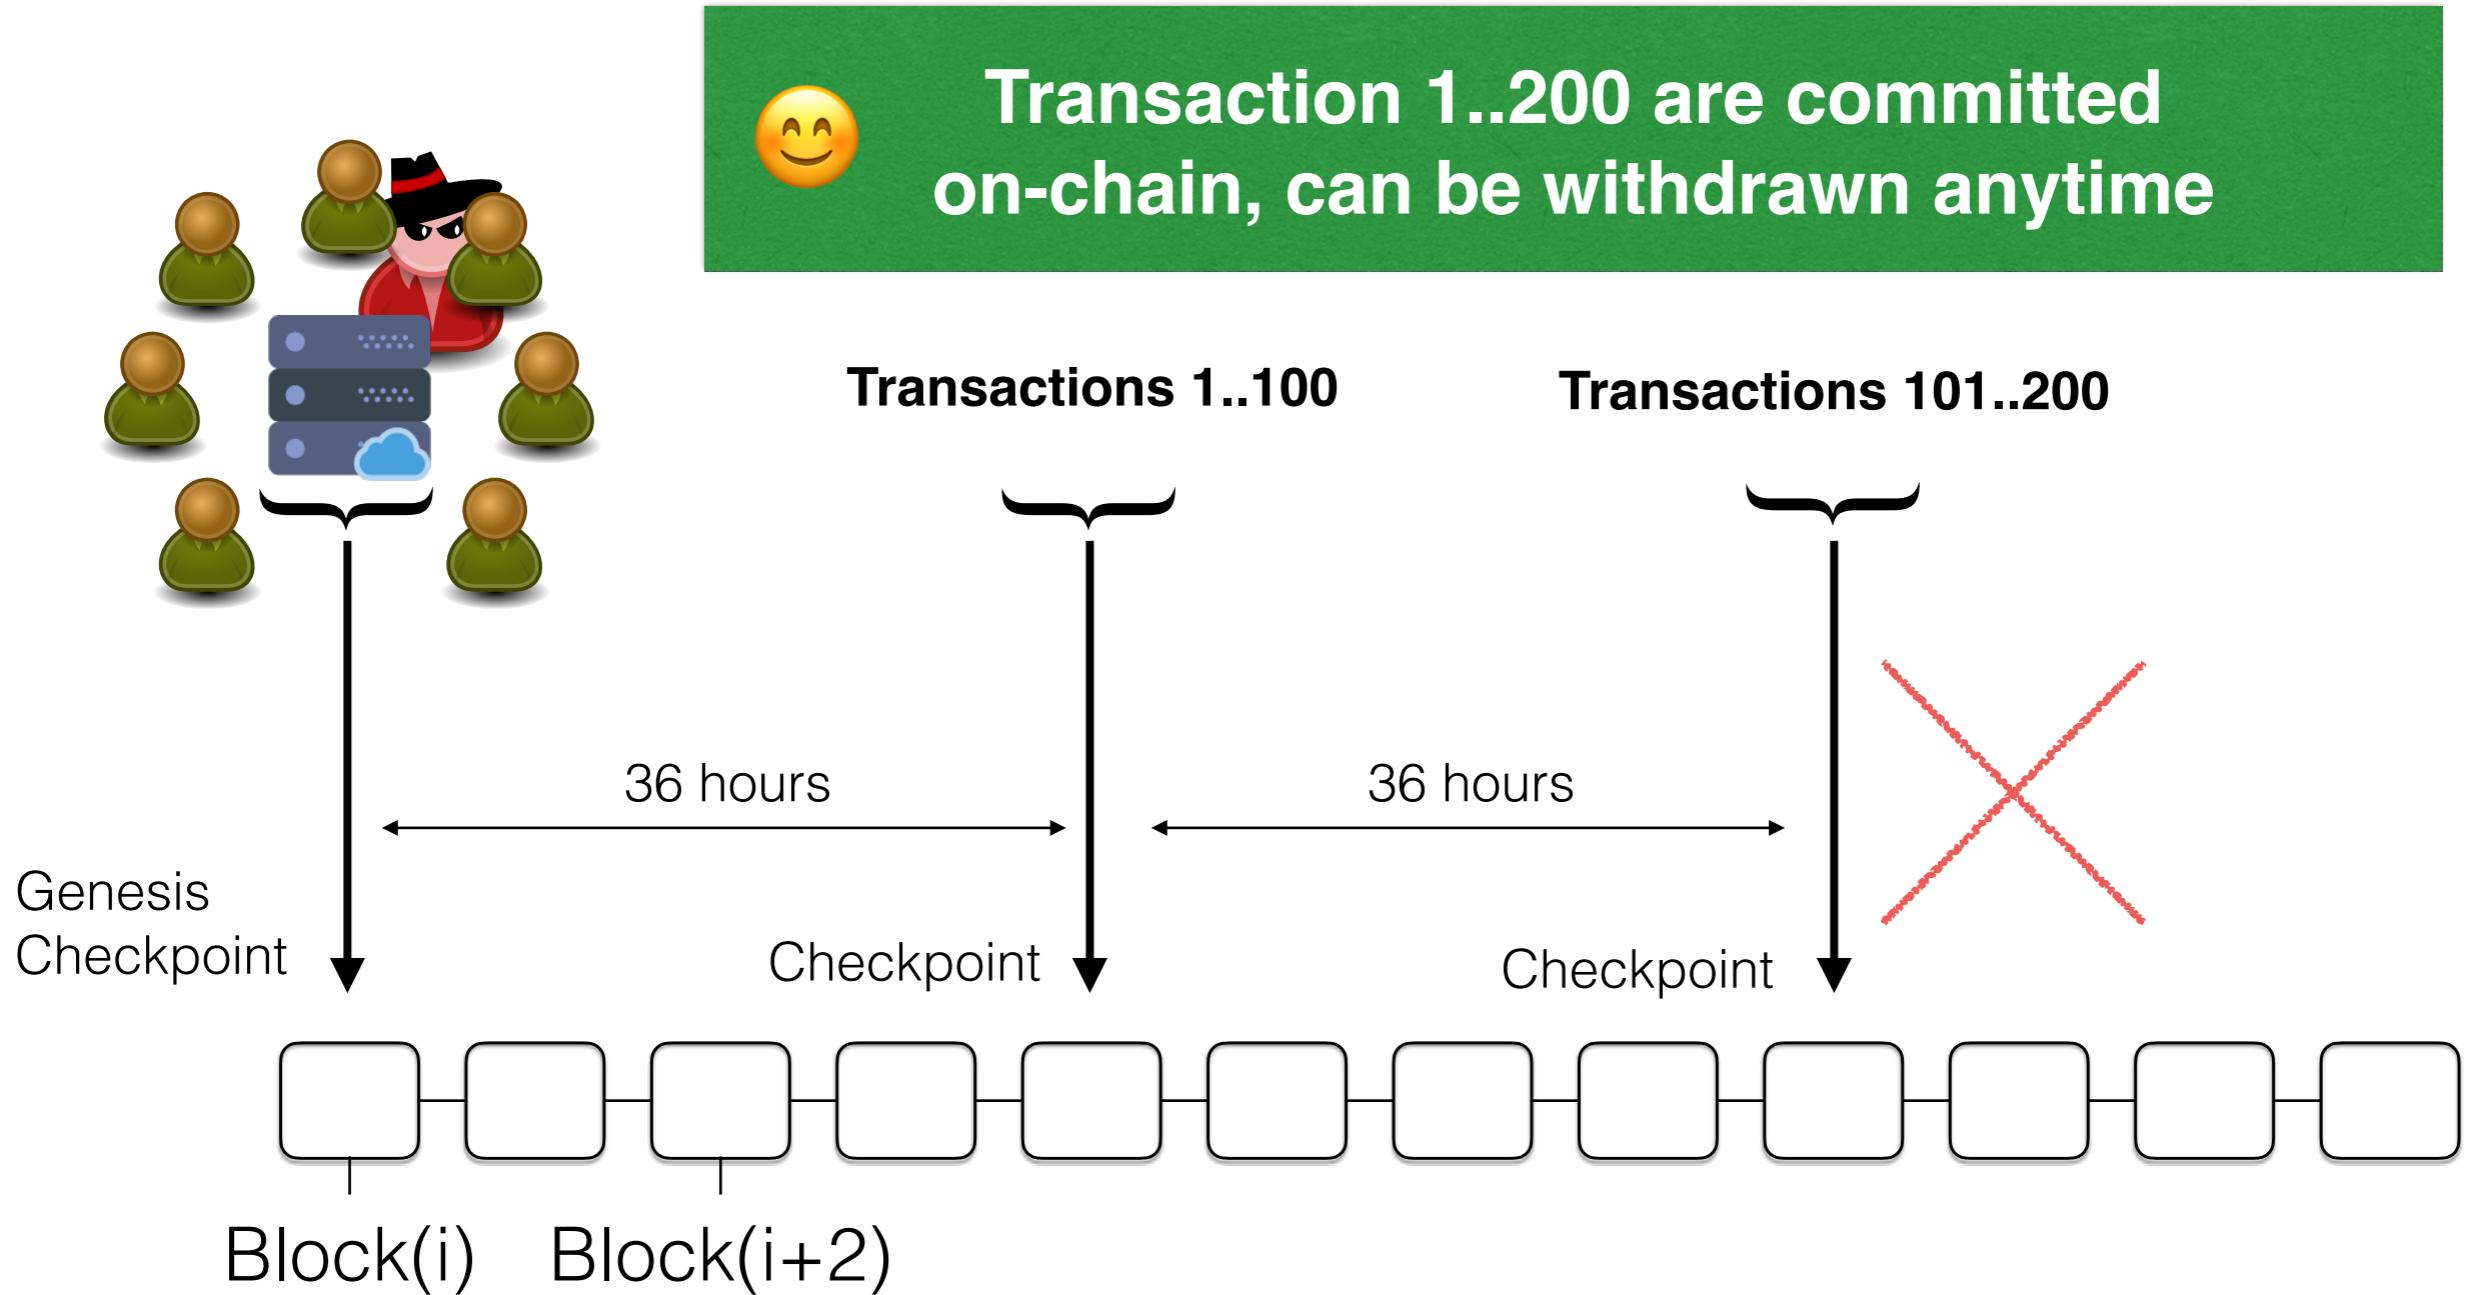

## Challenge (ZKP)

**Commit-Chains**  
**NOCUST Security**

# NOCUST operator disappears ... just after checkpoint

# NOCUST server disappears ... after a few transactions

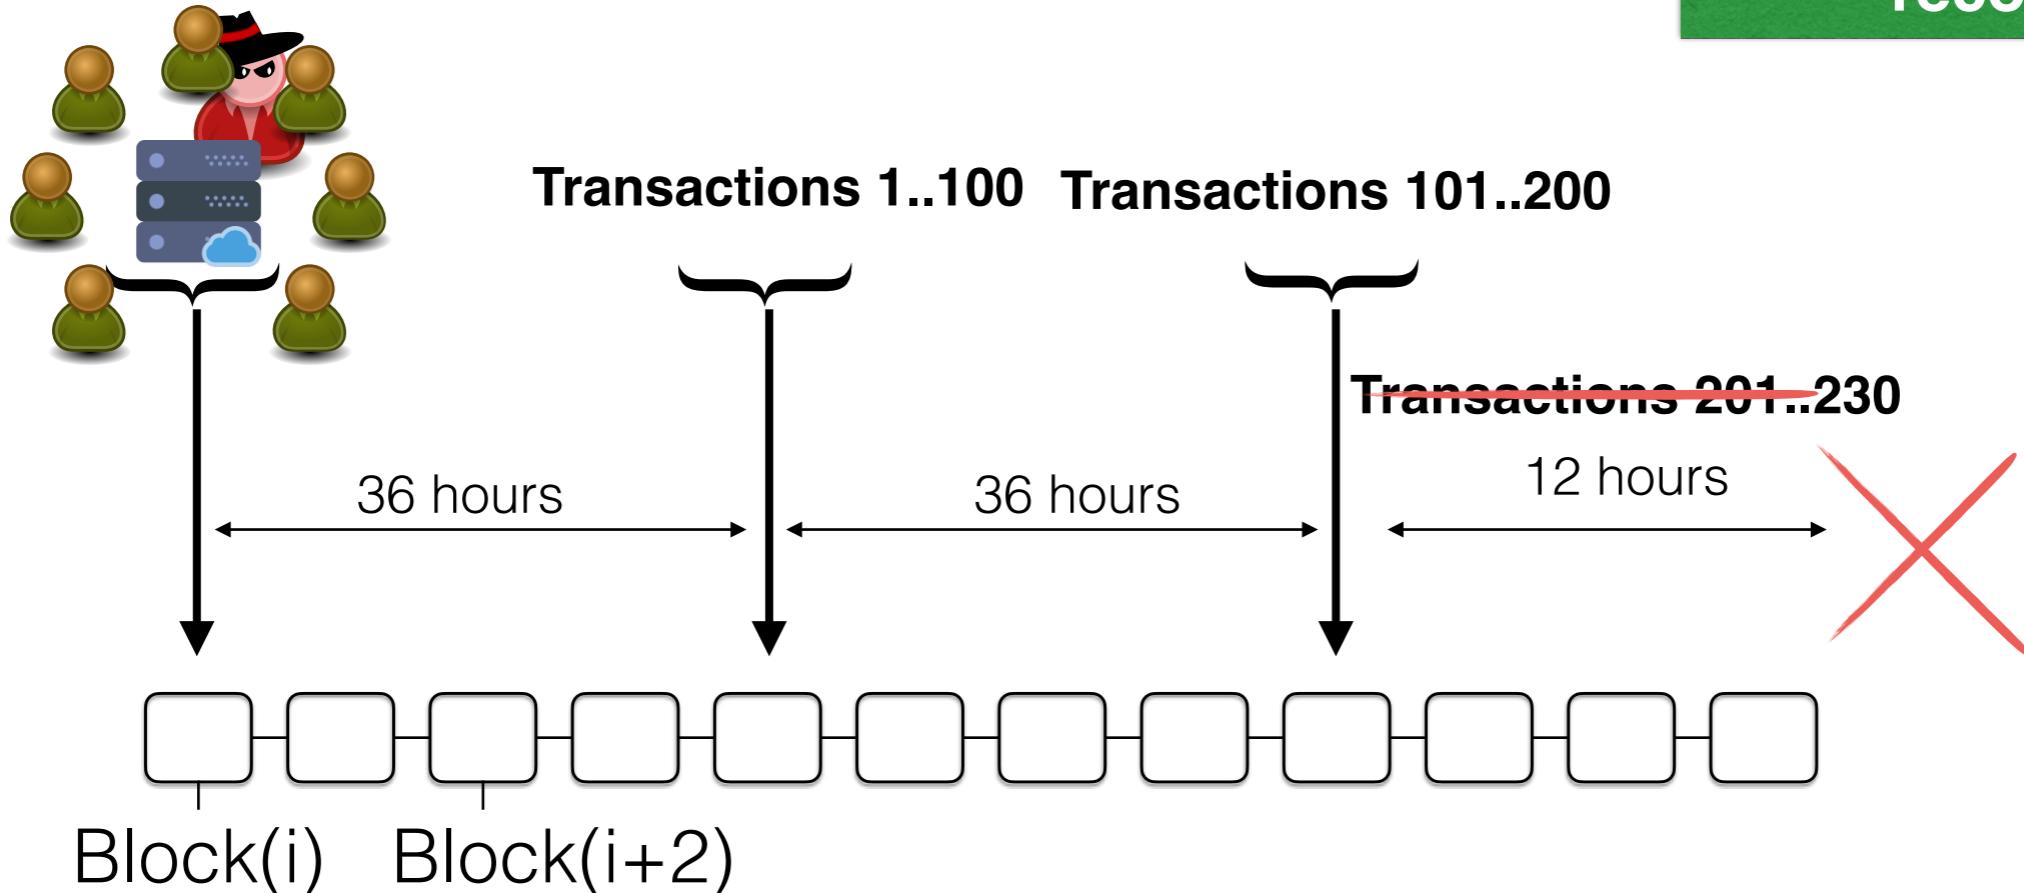

Transaction 1..200  
are safe

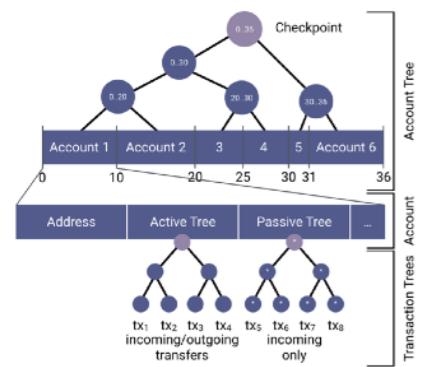

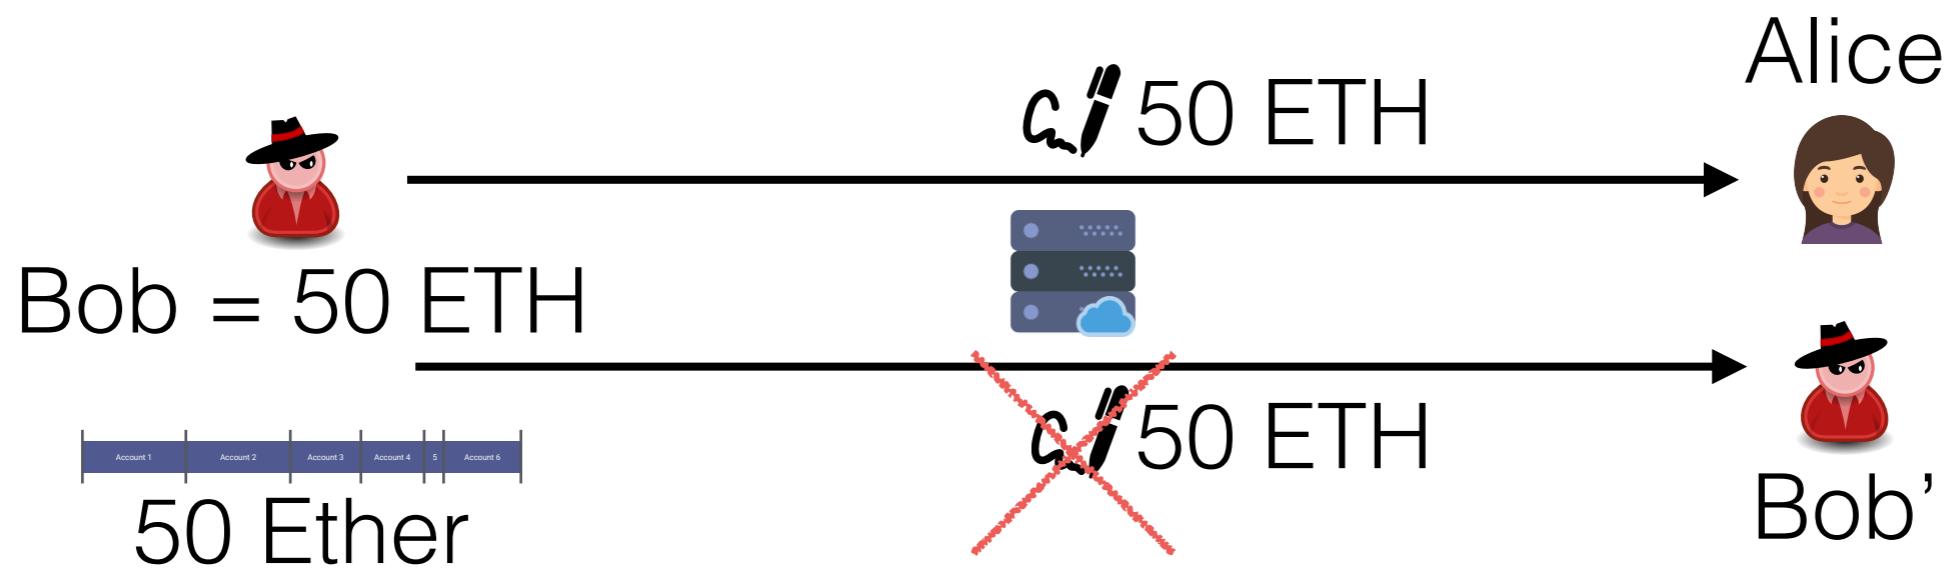

Transaction 201..230 are  
not committed on chain!

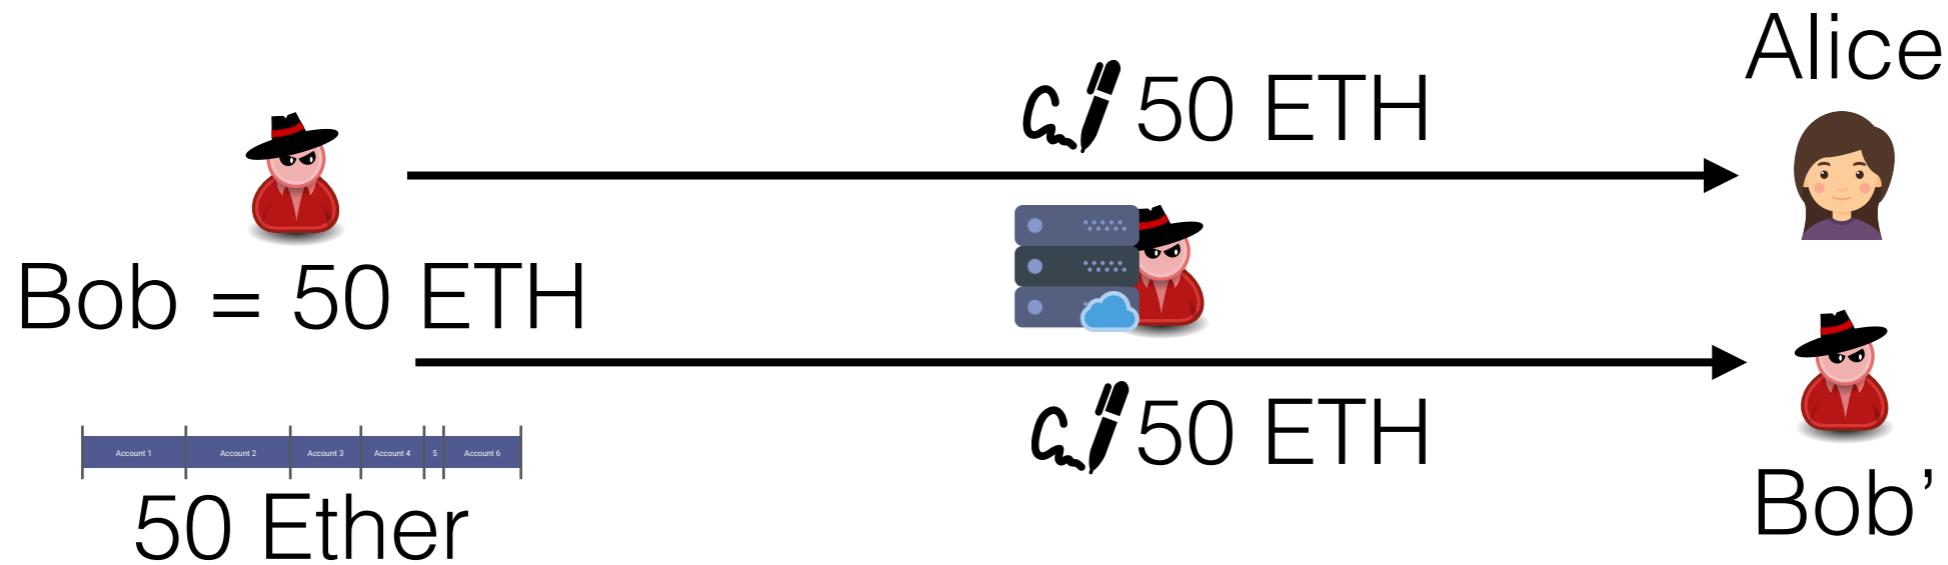

Insurance Pool  
recovers tx 😊

# Users to attempt double-spending

# NOCUST server colludes with client to attempt double-spending

Attempt to create coins

50 Ether != 100 Ether

**Operator is challenged !**

Attempt to steal coins

50 Ether of Alice are lost  
**Operator is challenged !**

A close-up photograph of a white boat's hull and a metal anchor chain against a dark blue sea. The chain is attached to a metal plate on the hull. The water is dark and reflects the light.

# Commit-Chains Summary

## NOCUST

Off-chain ledger state:  
**user balances**

**Fungible payments**

**Slower delayed finality**

**Lightweight clients**

**Instant finality support**

**Atomic Off-chain Swap (TEX)**

**Regular online presence to watch  
malicious state changes**

## NOCUST-ZKP

**- trusted setup for ZK**

**+ users without incoming  
transaction can stay offline**

**+ non-interactive challenge**

## Plasma (Cash)

Off-chain ledger state:  
**coin serial number**

**Non-Fungible payments**

**Rapid delayed finality**

**Large amounts of history data**

**No instant finality support**

**No known feasibility for swaps**  
**Regular online presence to watch  
malicious withdrawals**

# The good, bad and ugly of Commit Chains

**Recipient can be offline to receive a transaction**

**Limited censorship resistance**

**No decentralization**

**No collateral for delayed finality**

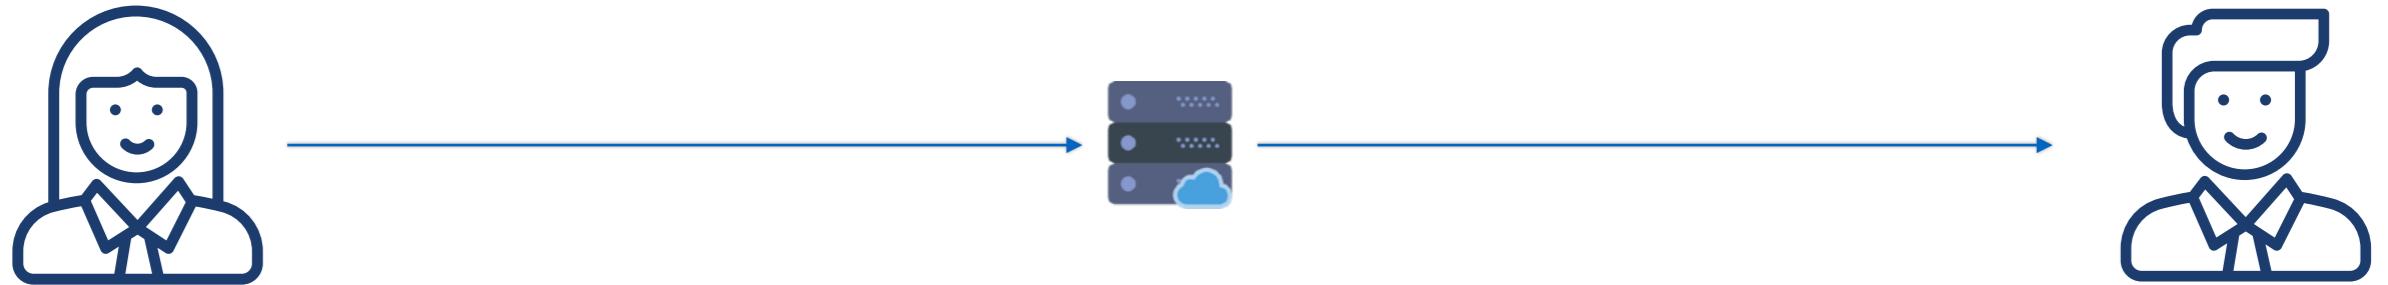

**Instant and free onboarding**

**Data availability challenges**

# What if we have a blockchain that scales significantly (wrt. latency and volume)?

## 2nd Factor and Location Verification:

Do you really want to spend these coins?  
-> Get notified and act upon misbehavior.

## Privacy:

Off-Chain transactions are not broadcast, **may** increase privacy  
Privacy is lost towards commit-chain operators.
